Westinghouse

**The Last Word in Iron
Efficiency**

**The Toaster That Turns
the Toast**

**The Cozy-Glow
Radiator**

Reflector—Spherical Segment. Rays projected with small percentage of focusing and practically no loss—due to lines and amplitude of reflector, and to shape and position of element.

Westinghouse Electric household appliances have the same dependable qualities that characterize Westinghouse motors, generators, transformers and other electrical apparatus known to electrical men all over the world as the highest standard of quality—as dependable. The Westinghouse idea of electrical and mechanical worth is built in every product of our works—from the largest generator to the smallest appliance—and the electrical dealer who serves the public with Westinghouse appliances knows his goods are, first of all, and most important of all—dependable.

50,000 Horse Power "SMITH" Hydraulic Turbine Installation

Shown in accompanying illustrations consisting of five single runner vertical shaft turbines, installed in concrete scroll cases.

Each unit develops 10,000 H.P. at 97.3 R.P.M. under 50 feet head and drives a direct connected vertical shaft generator.

Above view, taken during construction of concrete sub-structure of power station, in which are moulded the curved draft tubes and spiral flumes for the turbines. Wood forms are being placed in position around the cast iron guide rings.

Illustration to the left shows one of the turbine units, complete with cast iron guide ring which is built into the concrete scroll here shown in section. All gate mechanism is outside the flume and easily accessible for inspection or repair.

Lower view shows the generator room, with its five vertical shaft generators equipped with direct-connected exciters, and thrust bearings which sustain the entire rotating weight of both generator and turbine.

If interested in Water Power development, write Dept. "N" for Bulletin of Designs.

HIGH TENSION EQUIPMENT

A Unit Type Installation—Bus and Wiring Supports

As Instinctively as They Look at the Clock for the Time of Day—

ENGINEERS desiring information on high tension equipment look to DELTA-STAR technical bulletins. Nearly everyone interested in high tension problems have these publications. If you have been overlooked just drop us a line and a set will be sent by parcel post. No obligation—we just want you to have them.

UNIT Type is a **plus** equipment: Bus supports **plus** adjustable top and bottom fittings; disconnecting switches **plus** real interchangeability; outdoor substations **plus** economy; pole top air break switches **plus** micrometer adjusters between phases; high tension fuses **plus** reliability. Real service **plus** prompt shipments.

UNIT Type Bus Supports are adjustable top and bottom—an original feature since 1912. There are over 7000 combinations.

Bulletins 31 and 31A give complete information. Send for them today

The Electrical Dealer's Best Business Getter

When a woman is pleased with the service she is getting from her suction sweeper, washing machine, mangle or fan, it is just as natural for her to talk about it to her friends as it is for her to breathe. As a real business getter she beats the best salesman the dealer can employ. And her help doesn't cost him a cent.

Since the motor is a vital factor in determining the kind of service any motor-driven device will give, the dealer should be sure of the motor when selecting electric-driven devices for resale.

When a device is equipped with a Robbins & Myers Motor the dealer can be sure of reliable

motor service from the device—the kind which makes friendly boosters of his customers. And he can also be pretty sure that the machine is quality built throughout.

Quality manufacturers of motor-driven devices naturally gravitate toward the quality motor when equipping their output.

The R & M Motor on an electrical device helps get the initial orders as well as the follow-up business, too. Years of dominant advertising in the leading magazines has taught buyers of motor-equipped devices the importance of the motor on these devices and the quality significance of the R & M Motor.

Benjamin Dome Reflectors

**R-L-M Standard
For Industrial Lighting**

THE Benjamin R-L-M Standard Dome Reflector is a one-piece lighting unit with no welded joints, and, therefore, has no metal edges exposed to the influences of corrosion. The method of connecting reflector and socket to the support is unusually strong.

The reflector is deep enough to afford ample protection against direct glare from the lamp filament, the angle of cut-off being $17\frac{1}{2}$ degrees, as required by the standard. Sharp shadows are prevented by well diffused light from the large reflecting surfaces. This reflector unit conforms to the requirements of the most exacting lighting codes.

Made to fit all styles of sockets.

Vol. 23

Toronto, October 1, 1919

No. 19

A Contractor, Whether He Likes It or Not, is a Merchant

What is a merchant?—A man who deals in some commodity—buys or sells it.

What is a commodity? Anything that may be bought or sold.

Name some of them.—Well, they may be divided roughly into two classes—(1) commodities that have physical properties, such as weight, dimensions, etc., and (2) more or less abstract commodities such as advice, experience, good will, accommodation, etc., which may be generally classed under the one heading—"services."

Then everybody is a merchant?—Assuredly. The grocer sells sugar; the doctor sells skill and experience; the engineer sells technical service. Every man and woman who receives pay from an employer, whether in the form of wage or salary is simply selling his "services."

A contractor is a merchant then, even if he doesn't call himself a dealer?—How could he be otherwise? Two or more contractors compete for a job; only one gets it. The best salesman—merchant. He was the one who displayed his wares—services—most attractively before the purchaser. The contractor who "bids" and neglects to follow up with "salesmanship," or "merchandising" stands small chance of winning out. The lowest price is not necessarily the most attractive, nor the highest the most impossible. "Service" jumps into the scales and may tip them one way or the other.

There is no excuse then for the contractor holding out

against handling appliances on the ground that he is not a merchant. If he is making a success of selling his services as a contractor he has only to apply the same principles to the disposal of other commodities.

Sure, the contractor is, and ought to be, a merchant.

Good Illumination an Important Factor in Greater Production

It cannot be said that there are any notable advances in illumination to report within the past few months, although it is plainly evident that the importance of good and proper lighting is constantly receiving more general recognition. This is particularly true with reference to industrial lighting.

A review of the industries shows a very real improvement in conditions. As soon as the war closed the prime need became efficient production, and as this was impossible under any but the most favorable working conditions, engineers and lighting specialists found the managements of the various plants in a much more receptive mood than formerly. This is still, however, practically a virgin field where electrical contractors may confidently look for greatly increased business opportunities during the next year or two.

A number of new industrial lighting units have come on the Canadian market which represent improvements and refinements in the art rather than innovations. This tendency will doubtless continue.

The cost of lighting equipment during the war has increased like most other things, though not, generally speaking, to the same extent. This was due largely to necessary curtailment of production and to the enhanced value of raw material and wages. Present indications are that the highest peak of prices has been reached, so that it now only remains to get our production established on a heavier basis. This accomplished, the prices should gradually recede.

A very real menace to Canadian manufacturers of lighting goods and appliances—as also to manufacturers in other lines, no doubt—is the almost certainty that Germany will attempt to get her goods into Canada and undersell the home-made product. It was said a few days by an American manufacturer who was recently returned from that country, that Germany is today following the "sanest" course of any country in the world. His remarks had reference more particularly to the labor situation concerning which he added that whereas, on this continent, labor is demanding 10 hours' pay for 8 hours' work, the workman in Germany is willingly accepting 8 hours' pay for 11 hours' work. This may not be a commendable condition for the German workman, but we must all admit it is the spirit which will most quickly extricate that country from its tremendous load of obligations. However, it confronts the rest of the work with this conundrum—if Germany does not work long hours for small wages, how can she ever pay her debts, and if she does, how can other countries compete with her.

The labor problem thus remains in this, as in other industries, the key to the situation. With losses attendant on frequent strikes, added to the increased cost of production which follows when labor wins its fight, we would appear to be reaching a condition industrially that may cause a nation-wide collapse. It is little satisfaction that this collapse would also involve the workman.

We do not suggest that better illumination is a solution of all these problems, but we believe it can be justly claimed that it can be a big factor. The workman is demanding better working conditions—what adds to his comfort, wheth-

er in the factory or home, as much as more and better light? The workman demands big wages—this means that he must produce more in the same time, and what improvement in working conditions can have so potent an influence on greater production, as sufficient and proper illumination.

Good lighting may not solve the big problem of labor and industry, but given a fair trial it will get matters on a proper footing upon which a better understanding and a closer co-operation can be built.

The Possibilities of New Business Greater Than is Generally Appreciated

On another page of this issue, we describe the wiring equipment recently installed in a home by an Ontario contractor, which ran into something less than 3% of the cost of the home. It will be conceded that this equipment will take care of the needs of this householder according to the modern ideas of surrounding one's self with electrical luxuries and conveniences. However, one cannot but be struck with the comparatively small outlay demanded by this installation, on the one hand, and, on the other, by the large field it opens to the contractor-dealer to follow up and make sales. For example, running roughly over the situation—we understand this householder has already installed an electric range at a cost of about \$250.00. That indicates that he is in the market for equipment of a good type, for example, a washing machine to cost \$175; an ironing machine to cost around \$400; a dish washer, \$250; a refrigerator, \$500; fixtures and floor lamps, \$300; sewing machine, percolator, vacuum cleaner, cigar lighter, small heater, toaster, iron, etc., etc., probably to the extent of \$200—a total of about \$2,000.

Does the contractor-dealer in general appreciate the amount of business that lies dormant in every home that he equips properly? Here is a sufficient reason why he should use all his persuasive energies to make every installation he handles as complete as possible. Not only does it net him a bigger figure in the actual installation of the wiring, but it opens up a very much larger field in the years to come. Further, the big possibilities in electrical appliances also show very clearly the necessity of an electrical-contractor so fulfilling his first contract with the owner as to win his confidence and gain a reputation for good judgment.

Better Wired Houses The Only Way to Create Desired Demand

The success of any manufacturing industry is chiefly dependent upon the demand. The old method of doing business was to sit back and wait for the demand to develop. To-day the up-to-date business man reverses the operation—he sets himself to develop the demand.

There is no place in the business world where this up-to-date policy is more essential than in the retailing of household electrical appliances. The natural development of the demand has been fair, but has now reached a stage where there is a decided tendency to lag. The electrical industry is organized up to a point—the manufacturer is in a position to supply goods; the jobber is well organized; the contractor-dealer is coming. The weak point in the chain is the demand in the homes.

In the nature of things the development of a demand for electrical goods is more difficult than with other goods, for the reason that their use presupposes a properly wired home with all the necessary outlets so rarely found even in new houses. Householders by the thousands have a de-

sire for electrical goods, but could not make use of them if they had them.

A lot of good money is going to waste in advertising and good energy in selling to supposed prospects who are not prospects in reality, for the reason that their homes are not so equipped as to allow the use of appliances. Yet in the face of this fact, ninety per cent. of the homes being built to-day have the wiring reduced to something below the "irreducible minimum."

Who is to blame? How can this condition be remedied? Whose business is it to remedy it?

Who is to Blame?

Answering these questions in order, we believe the architect and the contractor are equally responsible for the present state of affairs. In the first place, the architect doesn't understand the advantages of a properly wired home and in the second place, he is too entirely absorbed in attending to mere details of architecture, while he keeps the cost of the building as low as possible. The contractor, for his part, gives the lowest possible bid on the job, knowing that if he doesn't, some one else will.

How Can the Condition be Remedied?

The condition so far as the architect is concerned can only be remedied by a process of education. Every architect should be a booster for better wiring. His co-operation should be enlisted to the extent that he will bring a certain amount of pressure to bear on his client. He should consult with the electrical contractor and give his moral support to any suggestion for improvements the contractor may make. And the contractor—well, he must stop this silly competition to see who can get away with the cheapest job. Everyone knows the cause of this condition. It is the existence of a few irresponsible "carpet-baggers," with offices under their hats, who camouflage themselves with a coil of wire and a pliers to look like responsible wiremen, who have no reputation to lose, no capital at stake, and consequently nothing to gain by doing a better job than the poorest the law allows. This class must be got rid of. When this competition is finally removed, bona fide contractors must set themselves a standard up to which every house job should measure. Any contractor who fails to

Now is the time to feature small heaters and radiators. The evenings and mornings are cool. The use of electric radiators delays the need for the furnace.

reach the standard on any job should be required to explain the reason of his failure to his fellow contractors.

Whose Business to Apply the Remedy?

Truly, the remedy of this weak point in our industry is everybody's business in the industry, for we all suffer. That is probably the reason why, in the past, it has been considered nobody's business. But we MUST get this stumbling block of poorly and inadequately wired houses out of the way. As already pointed out, the architect can do a lot of missionary work; so can the contractor; but the responsibility falls no less on the manufacturers and jobber. These two classes suffer most because the mouth of their distribution channel is closed and the channel becomes choked up in consequence.

Only One Solution.

There is only one solution—better wired houses. The

architect can't do it alone nor the contractor, nor the manufacturer, dealer or jobber. But, working, together, they could organize and carry through such a campaign as would double and treble within a year the possibility for the use of electrical devices in the homes. Let us face the issue fairly. There is little difficulty convincing a man or woman of the luxury and utility of electrical devices. The real difficulty arises when we have to admit to him that he couldn't use them if he bought them.

Revision of Inspection Fees

The Inspection Department of the Hydro-Electric Power Commission of Ontario has issued a new set of prices, which will take effect October 1, as follows:

Incandescent Light Wiring

1 to 5 outlets.....	\$1.00
6 to 25 outlets.....	.15 each additional
26 to 100 outlets.....	.10 " "
101 to 200 outlets.....	.07 " "
and over 200 outlets.....	.05 " "

The above fees entitle contractor or applicant to one inspection only. Where service work and hardware is furnished by another contractor a separate application and inspection is required. Minimum fee—\$1.00.

Electric Signs

Electric Signs, each.....\$1.00
More than one sign on same building .50 each additional

Motors

¼ to 10 H.P., each.....	\$1.00
10 to 25 H.P., each.....	1.25
Above 25 to 100 h.p. each.....	1.50
Above 100 H.P., each.....	2.00
Over 550-volt, each motor installation.....	5.00
And each additional motor in same premises.....	3.00

Generators

Same charge as for motors of same rating.

Fixtures

Inspection of fixture installations will be charged for at half the rate of incandescent wiring scale, rating each fixture as an outlet; minimum fee to be 35c.

Special Inspections

For photographic, bell-ringing systems and arc lights, or where no special fee is provided, inspections may be made at the rate of \$1.00 per hour, as well as any traveling expenses.

Special Theatre Inspection

A charge of \$1.10 is to be made for the inspection of electrical apparatus and material on the stages of all play-houses before same can be used. These inspections to be made on Monday mornings by all district inspectors.

Permit Fees

A fee of 10c is to be charged for each and every permit.

Temporary Permit Fees

Temporary permits will be issued at a minimum charge of 25c, for every permit thus issued. Where special inspections are necessary in connection with the issuing of temporary permits a charge of \$1.00 will be made to cover the inspector's time and expenses.

Refunds

Where more than one application has been filed in error for the same job, or where wiring contractor has overpaid the inspection fee through error or otherwise, the fee will be refunded, less 25c.

Ranges and Heaters

Each range or heater, including wiring thereto.....	\$1.00
Each additional range or heater in same premises.....	.50

Where the above can be inspected along with wiring for the same contractor, the fee will be 50c. for each installation.

A Weak Objection to Safety Cars

The Trades and Labor Council, of Sydney Mines, N. S., have communicated to the Cape Breton Electric Company their disapproval of the system of pay-as-you-enter recently inaugurated. They point out that in stormy weather and particularly during winter months passengers will be subjected to annoyance and discomfort by having to take their turn in boarding the cars. Mr. Curtis, the superintendent, in his reply said that he welcomed constructive criticism and suggestions from the travelling public and patrons. The new system of collecting fares had the most advantages and the fewest disadvantages of any the company could work out. A passenger riding from one town to another prefers to pay his fare upon entering and not have to be bothered again. Mr. Curtis regretted very much that people should have been obliged to stand out in the rain even for one moment while waiting to board the car, but it was difficult for the company to furnish instantaneous shelter for prospective passengers.

Hydro Commission Issues Sixth Edition of Rules and Regulations

The Hydro-Electric Power Commission have just issued the sixth edition of Rules and Regulations for electric wiring. This book is bound in the same manner and is the same size as previous editions but contains many new illustrations taken from work in our own Province which indicate more clearly the methods which they are intended to cover. The book also contains much useful data at the back which was not in previous editions. All regulations to date are included in this sixth edition, including outlet boxes on knob and tube work which will come into effect on January 1st next.

We are advised that, as the Commission has distributed many thousands of these rule books gratuitously, it will be necessary hereafter to make a small charge for each copy. Copies may be obtained from any of the district electrical inspectors upon payment of 25 cents for each book. They will be available in any quantity not later than the first of October.

Sherbrooke Tramway Fares Increased

By a majority of 513 in votes and \$3,725,810 in valuation, the ratepayers of Sherbrooke, P. Q., have passed a by-law amending the agreement with the Sherbrooke Railway and Power Co. This by-law, already passed by the Council, provides for an arrangement by which the city will do certain paving work, the cost to be reimbursed by the company. The fares are to be as follows: From 6 a. m. to 12 p. m., 8 cents, or four tickets for 25 cents; from 12 p. m. to 6 a. m., 15 cents cash; children under 14 years, 4 cents cash or 8 tickets for 25 cents. These fares are to remain for 12 months, and are to be subject to revision every 12 months at the request of either the city or the company, the Quebec Public Utilities Commission to decide in case of disagreement. The company is free from the cost of snow removal for a period of five years. The company agrees to extend the system at once, and to double track a portion of its lines.

At the annual meeting of the Marconi Wireless Telegraph Co. of Canada, held in Montreal, the shareholders confirmed the appointment of Mr. A. H. Morse as managing director; Mr. J. N. Greenshields, president, and Mr. T. Robb, formerly general manager, vice-president. The shareholders, at a special meeting, passed a scheme for reorganising the capital.

Comments on Illumination

By Mr. A. W. Shenton

All of us have a tendency to draw a more or less sharp distinction between illuminating engineering as set down on paper and as encountered in actual practice. We might say that there has been a tendency to classify illuminating engineering as of two kinds—first, the theoretical or text-book variety, and second, the practical variety. That these two are one and the same thing should be borne in mind by all of us and the only way technical treatises on illumination will have a practical value is by the reader being able to associate practical considerations with the material on the printed page.

To illustrate, an exposition on the importance of vertical illumination may be swallowed whole without having any future bearings on the reader's attitude toward this principle in practice. Let the reader, however, perform the simple experiment of working at a bench which we will assume is lighted in a manner very common, namely, by means of a good reflector unit hung directly over the middle of the bench. Now let him take a board and a square and mark this board to be sawed off square. He will probably have no trouble seeing satisfactorily to do this part of the work, for he will lay his board flat and will probably without conscious mental effort so place it that the shadow of the edge of his square will not interfere with accurate marking. Now, if he will clamp the board in the vise, with the marked surface facing toward him, and will try to follow his mark with a saw, once and for all the matter of vertical illumination will take on a new meaning which will endow any printed matter on the subject that later comes to his attention with a realness that fits in with personal experience.

If you are trying to write a letter at night in a room with direct lighting from open reflectors with clear bulb lamps and your paper is moderately glossy, you will, before writing many lines, realize the annoying effect of specular reflection in office lighting or industrial lighting. You will probably unconsciously shift your position so that the specular reflection is directed away from the eyes instead of toward them. Even in the milder case where you are writing on a dull finish paper, the specular reflection from the trail of undried ink following your pen point will be a source of considerable annoyance. The shadow or shadows,

as the case may be, of your pen chasing across the page will further emphasize the need for diffusion in this case if your mind is open to the consideration of illumination principles as well as the more immediate object at hand.

If you go into some industrial plant where the lighting is not what it might be, and perform the simple experiment of taking your watch out of your pocket to see what time it is, you probably will encounter for a moment what workmen in the shop are obliged to encounter hour after hour. Probably the first thing you will do unconsciously and automatically will be to shift your watch so that the specular reflection of lighting units in the crystal will not interfere with vision. Try to read the time by means of the minute hand to an accuracy of, say, one-tenth of a minute, and you will know what a machinist in the shop is up against many times during the day. Stand off at one end of the factory and try to distinguish different objects and persons at the opposite end of the room. If direct glare from the lighting units is present to an objectionable extent, you will soon recognize its effects, and will find that it does not take a thorough-going illuminating engineer to recognize glare and its harmful effects. If the work being done in the factory calls for considerable work on polished surfaces, take a pocket mirror or piece of polished metal and see with what success you can duplicate with artificial light the stunt that the mischievous schoolboy does when he redirects the sun's rays into his teacher's eyes. If the stunt is successful and you are able to get a rise out of someone in the factory by so doing, you can set it down that the lighting installation does not fulfill the requirements of good illumination for a factory where work on polished surfaces is being carried on.

And so on, we might cite a number of simple experiments whereby one can build up his own theories of what constitutes good illumination, and when he refers back to the printed matter published on illumination, he may be surprised to find how closely his own findings will check with those of illuminating engineers who have written on the subject. In fact, the main difference between men who have become recognized as illuminating engineers and the rest of us is that they have cultivated this analytical frame of mind in regard to illumination and have reduced their findings over a number of years to printed theories on the subject. The articles thus resulting are very often considered dry reading simply because the reader is not able to connect them up with practical experiences of his own that coincide with the tenets of such articles.

Good Lighting Reduces Accidents, Improves Physical Condition and Speeds Up Production

"Insufficient and improperly applied illumination is a prolific cause of industrial accidents. In the past few years numerous investigators, studying the cause of accidents, have found that the accident rate in plants with poor lighting is higher than similar plants which are well illuminated. Factories which have installed approved lighting have experienced reductions in their accidents which are very gratifying.

"Of even greater importance, poor lighting impairs vision. Because diminution of eyesight from this cause is gradual, it may take the individual years to become aware of it. This makes it all the more important to guard against the insidious effects of dim, flickering light, of sharp shadows, of glare reflected from polished parts of the work. To conserve the eyesight of the working class is a distinct economic gain to the state, but regardless of that, humanitarian considerations demand it.

"Finally, inadequate illumination decreases the production of the industries of the state, and to that extent, the wealth of its people. Factory managers, who have installed improved illumination, are unanimous in the conviction that better lighting increases production and decreases spoilage."

A Few Examples of Weave Room Illumination in Textile Mills

By Mr. Kenneth A. McIntyre*

The time available, since the installations described below were completed, has been insufficient to permit of making tests of actual results secured in the several plants mentioned. Design data are not given because of the absence of test results for comparison. Remarks, for the sake of brevity, are of a general nature and the development based on experience leads to a conclusion applicable to most problems of industrial illumination.

Few industries require better illumination than the textile industry because of the fine and exacting nature of the processes. The attention centres in the weave room which is invariably the first point of attack in improving the illumination of any textile mill. Therein can be obtained the greatest results in increased production and improved quality of product. Textile machinery requires considerable floor space with the result that most mill buildings approach or exceed 100 feet in width, the weave room being usually on the ground floor. Thus artificial illumination is required down the centre of the building throughout the day. The vital factor of effective weave room illumination has resulted in the adoption, by leading mill engineers, of the plan of placing the weave room in a building or "Weave Shed," so called, by itself, one storey in height and with "saw-tooth" roof construction solely, to provide proper illumination during the daylight hours.

Less than ten years ago the "well lighted" weave room

*Beattie-McIntyre, Ltd., Toronto.

had at the most one drop light over each loom, using a carbon lamp usually with flat tin shade at a height directly opposite the eyes of the operator. Tungsten lamps reached a stage of reliability and were forthwith substituted for the carbon lamps in the same sockets and with or without the same flat tin shades, causing many times the glare because of higher intrinsic brilliancy—with consequent greater eye-fatigue. The end was worse than the beginning. This condition obtained a few years ago in the weave room of Canadian Cottons, Limited, Hamilton, prior to adoption of the scheme shown in Fig. 1. The operator cares for looms on both sides of the aisle, therefore layout of machines consist of long rows of looms with alternate operating and back aisles. Sixty watt Mazda "B" lamps were used with Benjamin deep bowl type, enamelled reflector sockets. Units in operating aisles were placed between each pair of looms, approximately 8 ft. apart with mounting height of 8 ft. In the back aisles alternate units only were placed and at a mounting height of 10 ft. Despite the fact that the product consists mostly of dark-colored fabrics, the light on the work was greatly increased. Since installation the long runs of conduit in the operating aisles have

Fig. 1—Canadian Cottons Ltd., Hamilton

Fig. 2—Canadian Cottons, Ltd., Marysville, N.B.

been shifted lengthwise to bring the units in line with centres of looms to minimize shadows cast by mechanism of looms. Note the interference by multiplicity of shafting, pulleys and belting. Here again electricity can be called upon to improve conditions by use of individual motors or by under-floor drive, eliminating line-shaft drive, which, at its comparatively high speed keeps the cotton lint disturbed, spreading it everywhere, making breathing a difficulty and depositing lint on lamps and reflectors, reducing efficiency. In this case the dark-colored lint, if not removed frequently, would greatly impair usefulness of the system.

In Fig. 2 is shown an installation with similar characteristics in another mill for the same company in Marysville, N. B. After three years of operation the management express their satisfaction. More than 600 units are in use in this one room, showing excellent results enhanced by

favorable conditions of lighter fabrics produced and of under-floor drive. Contrast the mechanical conditions in Figs. 1 and 2.

A peculiar problem was encountered in the illumination of the weave room of the Oriental Textile Company, Limited, Oshawa, Ont., and solved as shown in Fig. 3. This mill produces high quality plushes and velours and weaving is affected by double shuttle looms weaving simultaneously two separate layers of fabrics with pile joining them. A special machine later cuts through this pile at right angles to it and makes two distinct pieces of velour or plush. Two warps are used mounted vertically one above the other, making a high structure with several layers of yarn through the harness of the loom. Shadows were to be minimized by either bringing the light from all directions or by providing portables to be carried as desired. Successful solution came with "eye-comfort" by use of National X-ray reflectors and fixtures. Two-hundred watt Mazda C-2 units are used on centres of approximately 14 feet. Ceiling is white and 12 ft. in height. The illustration was taken at night. The clear appearance of the ceiling is due to the adoption of individual motor drive. A further advantage is that machines can be moved without requiring changes in location of lighting units.

Fig. 4 illustrates the weave room of Imperial Cotton Company, Limited, Hamilton, recently completed. Five years ago the room was lighted similar to that shown in Fig. 1. The arrangement was similar but the looms in this case were nearly twice the width, the number of units considerably less. This disadvantage was somewhat offset by the nature of the product, principally white cotton duck. During the past year, however, the entire plant has undergone extension and rearrangement. In the weave room all the new looms installed are equipped with individual motor drive with advantages already mentioned. The new lighting system was designed by the engineers, Lockwood, Greene & Company of Canada, Limited, in conjunction with the writer. Benjamin deep bowl enamelled reflectors are

In conclusion, a system of general illumination is desirable not only in weave rooms but in most industrial plants. Special auxiliary lighting can be devised where really necessary. The Mazda C-2 lamp with its larger and more efficient units makes general illumination commercially practicable and increased production will repay, over and over again the investment in properly designing a new in-

Fig. 4—Imperial Cotton Co., Ltd., Hamilton, Ont.

stallation or remodelling an old one. Machinery can be located at will without it being necessary to consider the lighting. The lamps are beyond the reach of an accidental jar or a nimble hand.

Letter to the Editor

Toronto, Canada, September 11th, 1919.

Editor Electrical News:

I have read with some considerable interest the paper published in your issue of September 1st, by Mr. John G. Learned. I notice in this paper that the words "extra outlet" are used throughout. It would appear to me that the use of this term is an unfortunate one. When building a house the one thing we all dread is the word "extra" or "extras." It would appear to me that there is very much more chance of the electrical contractor being successful in obtaining orders from his clients to put in the very necessary outlets, if he used some such words as "utility outlet" rather than "extra outlet."

Yours very truly,

S. L. B. LINES.

Fig. 3—Indirect lighting in Oriental Textiles, Ltd., Oshawa

used with 200 watt bowl frosted Mazda C-2 lamps. Alternate rows are staggered and spacing is on 16 ft. centres, along the diagonals. Mounting height is 12 ft. Bowl frosting is used to reduce the little direct glare. Control of light, as in the other examples given, is switches located in distributing panels. Circuits are arranged parallel to windows so that only necessary inside circuits are in use during the day.

Owing to a falling off in miscellaneous revenue and higher fixed charges, the annual statement of the Quebec Railway, Light, Heat & Power Co. shows a deficit of \$65,274, compared with a profit of \$95,307. The gross revenue increased by \$279,768 to \$2,077,621, and operating expenses by \$208,792 at \$1,444,516, the net operating revenue being \$633,105, a gain of \$70,977. The board for the current year is constituted as follows: Lorne C. Webster, president; Hon. D. O. Lesperance, vice-president; Chas. Lavigne, L. J. Tarte, Arthur Picard, Paul Galibert; T. S. Stewart, M. P., Brig.-Gen. A. E. Labelle, Senator Jules Tessier, J. N. Greenshields, K. C., and C. G. Greenshields.

Canadian Electrical Dealers Realizing the Necessity of Attractive Stores—Two Fine Examples

[One of the finest electrical stores west of Winnipeg is "The Electric Shop," of Saskatoon, Sask., situated at 150 Second Avenue North. Mr. D. F. Streb, manager of "The Electric Shop," is a strong believer in making his electric store so attractive and efficient that the public is unconsciously drawn to it. This is undoubtedly the proper way to eliminate the competition of hardware and other general stores which is doing the electrical industry so much harm on account of their lack of knowledge of and sympathy with things electrical. We are glad to be able to reproduce some photographs of Mr. Streb's store and a brief description of its lay-out and the principles underlying the merchandising policy of "The Electric Shop." The salvation of the electric industry hinges on just such stores as this one.—Editor.]

The success of a retail electrical store involves the same principles and common sense methods that go to make any retail store successful.

The store should be so arranged that it will have a home-like appearance, be convenient for the public to enter, the merchandise so displayed that it will have an appeal to the customer, and be kept perfectly clean and dustless with all nicked ware and parts well polished, and easy chairs located at convenient places for the ladies to sit down and feel at ease in selecting merchandise and making purchases. Your goods must be well displayed and to the best advantage, easy to show and demonstrate.

You must be well versed in all merchandise you handle so that you can point out its merits and answer all questions put to you by your customer in plain English language, and not pour forth a lot of technical terms, which will confuse your customers and render it more difficult for them to make up their mind to buy.

Our policy in purchasing goods is, of course, to sell them, and in order to be able to sell them with confidence we buy what we believe are quality goods and nationally advertised as we find that nationally advertised goods move more readily and require less time to sell.

Should any article not prove satisfactory to any of our customers, we either replace it or make a satisfactory adjustment, and this policy we carry out not only in selling

merchandise but also in making repairs or any construction work that we may do.

Our customers are cordially greeted upon entering the store, are treated with tact and courtesy while in our store and whether they purchase or not are treated with the same cordiality upon leaving, so that on the whole we aim to leave the customer with a pleasing impression and a desire to return.

With a brief reference to prices, these are the same

The Electric Shop of Saskatoon has an attractive appearance to the passer-by

to all customers as we have one price only and that is marked plainly on the article.

We advertise two or three times each week in the evening paper, the amount of advertising being consistent with our gross turnover per year.

We do not have any special sales stunts but are quietly and constantly at our oars, and leave no stone unturned that will help to popularize our store and make it the headquarters for things electrical.

We believe that square dealing, quality and satisfaction will bring success to any store if consistently adhered to and

Interior views of The Electric Shop, Saskatoon. Mr. Streb has the faculty of so placing his goods that they sell themselves and at the same time suggest other purchases

Popular Priced Electricians, Hamilton, Ont. Perhaps a little crowded, but very effective

Popular Priced Electricians, Hamilton, Ont. Everything in full view

that price is not the determining factor, as the cut-rate store will sooner or later succumb to the inevitable.

With a brief reference to the layout of our store, you will note that we have two glass show cases and one counter with a show case front. In this counter show case front we have displayed various small articles which are kept in the drawer cabinet directly behind. This drawer cabinet has about 90 drawers in which all small articles are kept conveniently at hand for quick service. The back of the show case counter we use for receipts and wrapping paper.

Under the drawer cabinet we have six large drawers in which are kept lamps and various cords.

The next back wall case is arranged for lamp cartons and irons while the following two cases have sliding doors in which all nickel ware is displayed. Underneath these three wall cases are kept surplus stock.

On the opposite side of the store is a vacuum cleaner stand with a rug in front for demonstrations, two glass shade displays and, in the rear, portable lamps.

The first glass shade display is arranged with lights underneath the shades, while in the shelves underneath our surplus stock is kept.

You will also note that all the cases are about two feet apart for the purpose of displaying a floor lamp.

In the center of the store are tables for displaying heating appliances, etc., while washing machines and ranges are displayed toward the rear.

Our fixtures are hung on twelve-inch boards suspended two feet from the ceiling.

We find this arrangement of the store as a whole very convenient, making it easy to serve our customers. Another point is that we are able to see all over the store from any point, the same being true of the customer.

Hamilton is Also Noted for Its Attractive Electric Stores

The "Popular Priced Electricians," 203 King Street East, Hamilton, have an attractive store and good windows, as shown by the illustrations herewith. Still more important, they take fullest advantage of these assets in bringing customers into the store and interesting them after they get in. They always try to maintain clean, attractive window trims and store interior. They also advertise extensively in local papers. Since commencing business, in June, 1916, in a very humble way, they have, through their aggressiveness, been wonderfully successful, having increased their floor space

at different times. Only lately they moved into their present home, which occupies a prominent corner on one of the main streets of the city.

This firm carries a good variety of nationally advertised merchandise, but supplements this with consistent local advertising. Mr. R. W. Farr, manager of the company, says that he is sometimes accused of advertising too extensively. He is of the opinion, however, that he simply spends money in this way that very many electrical dealers lose by allowing a great deal of waste, odd and broken lines to accumulate, or by letting bad debts creep into their books. Mr. Farr

Popular Priced Electricians, Hamilton, Ont.—Good windows, well dressed

is very careful to keep their accounts up to date and ever watchful that no dead stock gets hidden away on the back shelves.

The city of Hamilton is well supplied with electrical stores, which competition, doubtless, accounts for the attractive appearance of many of them. They do not find, however, that there is not business enough for all. The experience, on the contrary, is that the more they specialize and the better they organize for merchandising, the more business there is for everybody.

This company also carry on a general contracting business, but, as the photographs indicate, they do not neglect the retail end of the trade, which they find extremely remunerative.

Illumination of Osgood Hall, Toronto, in honor of Prince of Wales' visit

Illumination During Visit of Prince of Wales

The above photo of Osgood Hall was taken at twelve o'clock at night with no other source of light than that used for decorations. On account of the trees being so close to the building it was necessary in order to get a picture of the entire building to take two distinct pictures.

James Devonshire, Limited, who received the contract for lighting, were successful in persuading the authorities to change their idea from outlining the building with small lamps to a system of flood lighting, pointing out that it would be impossible to show up the splendid architectural features with a system of outline lighting. On explaining the system of flood lighting permission was given to go ahead but with the following instructions:

To erect no poles on the grounds, have no obstructions, and not to cut a single branch of the trees.

As the foliage on the trees is particularly heavy it was quite difficult to place reflectors to any advantage. After some juggling and tying of branches it was possible to mount the reflectors in such a way as to place the rays on the building in a fairly even beam, and by removing the lamps on the Hydro pillars immediately in front of building and placing reflectors in their place sufficient light was obtained to cut the biggest part of the shadows caused by foliage of trees. In all, six flood lights were installed in trees and four reflectors on pillars.

Exclusive Right Belonged to Owner of Apartment House

John Quinlan's freedom to make a contract with the city of Westmount and to grant to the city exclusive right to supply electric current to the tenants of his apartment house on St. Catherine street, Westmount, notwithstanding any privilege the Montreal Light, Heat and Power Company might claim to have to supply electric light to the said tenants, was upheld in a judgment Mr. Justice Greenshields handed down in the Superior Court yesterday. The action was dismissed in which the Montreal Light, Heat and Power Company sued Mr. Quinlan and the city of Westmount for \$1,000 to compensate the company for loss of profits on contracts they had with the Quinlan tenants.

Some years ago Mr. Quinlan entered into a contract with the plaintiff company for the lighting of the halls and corridors of his apartment house at Westmount. When this contract expired it was not renewed, but a contract was made with the city of Westmount to supply the light.

There is only one main service wire entering the building. This belongs to Mr. Quinlan and as, under the new contract, the wire was handed over to the Westmount lighting authorities, the Montreal Light, Heat and Power Company found itself cut off from means to supply electric

current to the tenants of the apartment house with whom the company had entered into contracts which extended beyond the limit of the contract with Mr. Quinlan. It was for damages through being deprived of means of service into the apartment building that the present action was taken.

"The apartment building," Mr. Justice Greenshields said in his judgment, "was equipped with only one main service wire, which was the property of Mr. Quinlan, and by means of which alone could electric current be supplied for lighting purposes to the halls, corridors and janitor's apartments and any and all other apartments in the house. On the 10th of October, 1916, the plaintiff's exclusive right to furnish electric current to the tenants of John Quinlan has ceased and terminated, and Mr. Quinlan was at liberty to grant such exclusive right to any person or company. In making a contract with the city of Westmount and granting to it the exclusive right to supply electric current to his tenants, John Quinlan violated no obligation due by him to the Montreal Light, Heat and Power Co. and was within his rights in instructing the city of Westmount to connect its supply wire with Quinlan's main service wire in the apartment building. The plaintiff's action and demand is unfounded in fact and in law."

The action as directed against Mr. Quinlan and the city of Westmount was therefore dismissed, with costs.

New Book

The Electrical Trades Directory and Handbook—published by "The Electrician," 8 Bouverie Street, London, E. C. 4, England; thirty-seventh edition; 1,330 pages; bound in blue cloth; price 15 shillings net. This, as the name implies, is a directory of the electrical engineering and allied trades. The new 1919 edition contains about 80 pages more than the 1918 issue, mainly due to an increase in the number of the entries in the alphabetical and classified trades sections of the British and Colonial divisions. Considerable improvements have been effected in the arrangement of the contents; the thumb holes and tabs facilitating reference. Five hundred pages in the book are given over to a large quantity of useful information.

When you've wired a man's house or factory you've simply scratched the surface of the possibilities for doing business with this client.

How to Get Profitable Industrial Lighting Business

PERHAPS many dealers will doubt the statement that less than half the industrial plants of the country are adequately lighted. Certainly the majority of plant owners will tell you on your first visit that their plant most decidedly is properly lighted. Perhaps it is, but statistics show that there is an even chance that it is not lighted in the **most efficient** manner possible.

When making up your mind whether you will or will not undertake an industrial lighting drive, do not assume that the plants in your vicinity are correctly illuminated. Go out and find out.

Not many years ago a salesman was selling illumination in Cleveland. Now, Cleveland has long been considered by many as a fountain head of illuminating knowledge. It, therefore, would seem logical that the standard of factory illumination of Cleveland should be exceptionally high. Perhaps it was high as compared with other towns but there was a woeful lack of properly lighted industrial plants. Not to mention any names, it might be stated that some of the plants with the poorest illumination "should have known better." Perhaps it was another case of the poorly shod shoemaker's children.

This is mentioned simply to prove that you can't go very far on supposition. You are going to be startled when you find the classes of industries which are still using only half-way good illumination.

What are the definite benefits which you will get from a hard drive after industrial lighting business? Here are some of them:

First: If a contractor, you will profit by the actual work of installing a better system.

Second: Whether contractor or dealer, or if both, you will profit by the sale of the lamps, shades and fixtures installed.

Third: There will be future profit in re-orders for lamps. It is your installation and, if properly handled, you will get the future lamp business from it.

Fourth: Every good installation means a satisfied customer—which brings you added business:

- (a) More lighting business from this and other plants.
- (b) Sales of other electrical appliances, motors, wiring supplies, etc.

Every good installation to your credit keeps talking and selling for you through future years.

Know the Facts.

No really profitable business can be had without making a sincere effort. Your first effort in seeking industrial lighting business must be to instruct yourself and your salesmen (if you have salesmen) in the principle of proper industrial illumination. This is not difficult. You do not have to "go to school" or sit up through long evenings and pour over text books. All of the facts which you will need to know can be obtained from publications issued by your lamp company. These facts are few and simple. You ought to know them as a competent member of the electrical fraternity.

If your organization is such that you employ salesmen, it is a part of their job to know the principles of proper illumination. See that they do know these principles and apply them. They will profit—you will profit.

Before going out yourself or sending out your salesmen you should plan to eliminate all unnecessary calls, all waste effort. Make sure that your list of prospects is 100 per

cent. perfect. You will probably be able to make a fair-sized list out of your own head. Add to this names supplied by your outside men, salesmen, wiremen, or any of your employees. Study this list carefully. See that it contains the names of the correct men in each case to be seen. You can well afford to spend a week or two in perfecting this list before you make any further effort to sell illumination. Send your salesmen out to get the facts first hand. Some good lists have been made by writing to the firms stating frankly what you want and enclosing a stamped return card for them to use in giving you the name of the correct party.

Much of your time and of your salesmen's time will be saved by the proper use of advertising. Newspapers, circular letters, folders—all are good. Probably for this sort of a campaign, however, advertising through the mails will give you better results. An excellent plan is to start your campaign with some newspaper advertising, following it up with convincing letters, folders and mailing cards. Your lamp company will gladly supply you with this material.

Don't Be Too Easily Discouraged.

Do not expect to get a very great percentage of direct inquiries as a result of this newspaper and mail advertising. Many contractor-dealers have become discouraged because they sent out a number of letters with return cards and

Note the contrast—your factory may have plenty of light but be poorly illuminated

received practically none of the cards back. This does not necessarily mean that the letters have not been read. Follow up your letters and mailing cards with personal calls and you will find that the prospect has been prepared, has been partially sold perhaps. In any event, the path of the salesmen will be made easier.

Do not make the mistake of aiming your shots too low. Don't try to sell the shop's foreman when he really has no authority to make any changes in the equipment of the plant. It is often easier to approach the president of a corporation than the lesser lights. However, you should not overlook the shop foreman entirely. A little tact will soon show who is the right man to approach. In some cases the president or general manager leaves questions of illumination to their subordinates, but even so, the president or general manager is vitally concerned with the output of the business. You are selling something which will increase that output. You are selling something which will

reduce the cost of production, reduce the amount of spoilage of material. Go to him with confidence that you can do these things and you will get a hearing.

A large number of your prospective customers will be skeptical. They will say "My lighting is good; I cannot see how you can improve it. I am not getting any complaints from my workmen and as far as I can see there is not an undue amount of defective material; nor are there more accidents than must be expected." Here's where you must show him. Use figures to back up your arguments.

Show Prospect the Facts.

Use an instrument like the foot-candle meter, for instance, which will show truthfully the actual amount of illumination which that factory is getting. The foot-candle meter will show the factory executive just exactly how much light he is getting in every part of his plant. It is a direct reading instrument which indicates the actual number of foot candles. With it you can show the contrast between the good illumination over a bench, perhaps, and the poorer lighting near an important machine; you can show the great falling off in useful illumination through shadows caused by the workmen and their machines. Your illumination tables will indicate the correct amount of lighting considered necessary for each class of work. The foot-candle meter will show what illumination is actually present.

If you are going after the industrial lighting business to any extent, you will find this instrument most helpful and a profitable investment. Ask your lamp companies about it.

But the foot-candle meter is not indispensable to the success of a campaign for industrial lighting business. The chief essentials are:

1. A knowledge of the principles involved—which you can easily acquire.
2. A carefully selected list of prospects.
3. A planned campaign of preliminary advertising.
4. A close and persistent follow-up with personal selling.
5. The right material correctly installed.
6. Faith in your ability to better your prospect's lighting system and the stick-to-it-iveness to make him believe in you.

Don't expect results too quickly. Keep at it. When you find a plant which you know is poorly lighted do not give up until you have landed the business.

Progress in Electric Lighting

At the last annual convention of the National Electric Light Association a number of interesting committee reports were presented. The reports not only refer to the technical points involved in installing lighting systems, but to the stimulation necessary to make the average business agent successful in placing new orders for wiring and equipment. Briefly the reports as summarized in the "Electrical World" follow:

Stimulation of Lighting Business.

Store lighting is of special importance at the present time since it is in this field of lighting that increased business can be secured quickly and easily. For this reason campaigns of an educational nature, supplemented by local effort, should be conducted in the trade and the popular press to emphasize the relation between good lighting and sales.

From the lighting point of view stores can be divided into three classes—(1) the large department and drygoods stores, which can usually afford to engage consulting illuminating engineers; (2) the distinctive shop in which individuality is the keynote (these should not be handled by the campaign method since it is the suggestion of artistic or novel methods of lighting which appeal to them most), and (3) small stores, which, though of little importance individually, are of great importance collectively and are best adapted to campaign treatment.

In a campaign directed at the latter the first step is to adopt one or two fixtures which can be obtained and stocked easily, to reduce the selling expense. Then a meeting should be called with local contractors to outline the campaign and decide on the price of wiring per outlet, terms of payment, method of financing, etc. This step can be followed by local advertising news stories on the value of good lighting, lantern-slide lectures before local merchant associations, mailing booklets to prospective customers, etc.

Street and Residence Lighting.

A plan for inviting all central stations to install a block of model street lighting was presented by the committee on lighting of streets and highways. The aim was that there might be a conspicuous demonstration of modern lighting efficiency in every city. The need for better lighting on interurban highways for the encouragement of motor traffic was urged, and the development of farm load and factory sign load along these highways to help finance the extensions was recommended.

The average gross revenue from residence consumers continued on about an average basis during the past two years, according to the sub-committee on residence lighting. Active selling of electric merchandise and the elimination of empty sockets are the principal methods of keeping up this revenue.

The average cost of securing old house-wiring contracts, including the expense of carrying the account, was approximately \$3 per contract in 1916 and 1917. Under the stress of financial conditions it was deemed advisable by one company to make this soliciting cost a part of the contract price. By this plan the company in question expects to save approximately \$20,000 during 1919.

The possibility of applying outdoor illumination to night work or recreation, monumental structures, pageants and festivals, flags and displays, is once more open. This load is not only desirable as a revenue producer, but as a means of focusing attention on the subject of lighting and keeping it alive in the minds of the people. The extension of outdoor lighting will, no doubt, stimulate higher standards of intensity in commercial lighting installations.

Industrial Lighting.

A marked interest was shown in the address given by William A. Durgin on "Our Manufacturing By-product" during which he demonstrated the proper method for illuminating industrial plants. Mr. Durgin showed how correct lighting has affected production in a number of industrial plants where he has conducted tests. His tests were carried on at much higher illumination values than those proposed by the I. E. S. and showed that with a 5 per cent. increased investment in lighting the plant production could be increased from 15 to 27 per cent.

Central Station Activities.

To help develop new lighting business, to improve existing lighting and to promote the satisfaction of present customers by giving them more effective lighting are the three commercial purposes of illuminating engineering in the central-station industry, according to the sub-committee on lighting of public buildings. To help achieve these

purposes the Commonwealth Edison Company of Chicago has just prepared a list of architects, builders and contractors to whom will be sent the schedule of rates of the company and information sheets on Edison service, information on modern methods of interior wiring, interior and exterior lighting, electric motor drive, etc.

For a similar purpose the Philadelphia Electric Company prepared a very attractive illustrated booklet on church lighting.

Lamp Equipment.

Very few departures have been made during the last two years in the design of equipment to provide better and simpler means of controlling and redirecting light, according to the committee on commercial aspects of lamp equipment. The big problem has been to furnish the proper equipment for gas-filled lamps.

As a means of helping the introduction of good lighting central-station men should foster the movement to introduce electrically equipped furniture. Many houses and apartments were wired before the day of portable lamps, and in such places the wired furniture often fills a long-felt want.

Program for 1919 Convention of Illuminating Engineering Society

It is the plan of the papers committee of the Illuminating Engineering Society to have each session of the convention at Chicago Oct. 21, 22, 23 and 24, so arranged that all topics discussed at the session will have a bearing on some single phase of the lighting industry. Tuesday afternoon's session will be devoted entirely to opening addresses and reports of committees; Wednesday morning's session to street lighting, searchlighting and photometry; Thursday morning's session to glare, the industrial code symposium; Thursday afternoon's session to papers of interest to commercial men, and Friday morning's session to papers on the design of interior illumination. Visits to the Chicago Electrical Electrical Trade Exposition and other entertainment features will occupy the time which it is indicated will not be taken up by convention sessions.

The program as arranged by George H. Stickney, Harrison, N. J., chairman of the papers committee, is as follows: "Presidential Address," Doctor George A. Hoadley, Swarthmore, Pa.; "Report of Committee on Automobile Headlight Specifications," Doctor C. H. Sharp, chairman, Electrical Testing Laboratories, New York City; "Report of Committee on Lighting Progress," F. E. Cady, chairman, National Lamp Works, Cleveland, Ohio; "Street Lighting With Low Mounted Units, Kensico Dam Drive," J. Howard Williams, former engineer New York Department of Water Supply, New York City, and C. A. B. Halvorson, engineer, General Electric Company, West Lynn, Mass.; "Recent Developments in Gas Street Lighting," F. V. Westermaier, engineer, Welsbach Street Lighting Company, Philadelphia, Pa.; "Searchlights in the War," Captain Chester Lichtenberg, office of the chief of engineers, War Department, Washington, D. C.; "A Universal Photometric Integrator," F. A. Bendford, illuminating engineering laboratory, General Electric Company, Schenectady, N. Y.; "Photo-Electric Photometry," Doctor A. H. Compton, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.; "Glare," Ward Harrison, illuminating engineer, National Lamp Works, Cleveland, Ohio.

"Symposium of Industrial Lighting Codes:"

(a) Introduction by L. B. Marks, consulting engineer, New York City.

(b) The code in Wisconsin, by J. A. Hoeveler, electrical engineer, Wisconsin Industrial Commission, Madison, Wis.

(c) The code in New York, by J. H. Vogt, director of industrial hygiene, State Industrial Commission, New York City.

(d) The code in New Jersey, R. H. Leveridge, chief of the bureau of electrical and mechanical equipment, Department of Labor, Trenton, N. J.

(e) The code in Pennsylvania, by a representative of the Department of Labor, Harrisburg, Pa.

(f) Insurance inspectors and the code, by R. E. Simpson, engineer, Travelers Insurance Indemnity Co., Hartford, Conn. "Opportunities for Extending Lighting Through New Applications," by R. M. Searle, vice-president, Rochester Railway & Light Company, Rochester, N. Y.; "Factory Lighting a Central Station Problem," by O. R. Hogue, head lighting agent and J. J. Kirk, illuminating engineer, Commonwealth Edison Company, Chicago; "A Survey of Industrial Lighting in Fifteen States," By R. O. Eastman of Fuller & Smith, Cleveland, Ohio; "Indirect Lighting of Rooms," by J. L. Stair, illuminating engineer, National X-Ray Reflector Company, Chicago, "Principles of Interior Illumination," by Bassett Jones, consulting engineer, New York City; "Co-Efficients of Lighting Utilization," by Ward Harrison and E. A. Anderson, Cleveland, Ohio; "Tests of Lighting Units," by VanRensselaer Lansingh, engineer, Cincinnati, Ohio.

The American Electrical Heater Company have issued an attractive bulletin, No. 5, illustrating and describing the American Beauty household equipment.

The Quebec Railway, Light, Heat & Power Company have asked the council to amend the contract with the company so that the tramway fare will be 7c straight within city limits, with 2c for a transfer ticket. Workingmen's tickets, it is requested, should be sold at the rate of 11 for 50c.

Guts

The title of my verse, I fear,
May jar upon the cultured ear
And shock the squeamish and precise,
Whose speech is always over-nice;
But yet the simple truth remains
That, whether men have brawn or brains,
The thing that lifts them from their ruts
Is guts.

With purpose firm as adamant
It meets the coward's whine, "I can't,"
And in a voice emphatical
Declares the doctrine of "I shall!"
It turns the idler's "It may be"
To roseate reality,
And laughs with scorn at "ifs" and "buts,"
Does guts.

It picks the fighter from the dust
In which he falls, and cries "You must!"
Til, heartened and aroused anew,
He struggles up and battles through.
It rips the planking from the floor
And bursts the oaken prison door
That Fate or Fortune coldly shuts—
That's guts!
Rufus T. Strohm in "Trumbull Cheer."

Lighting Efficiency Foremost in Design of New Plant at Montreal

OF the many interesting features of design and construction embodied in the new building of Messrs. Crane Limited, at Cote St. Paul, Montreal, features which combine to make this plant one of the most up-to-date of its kind in the Dominion, the most conspicuous is illumination.

It may be of interest to note that this plant is to be the main Canadian branch of the Chicago firm of Messrs. Crane Limited, manufacturers of plumbing and steam-fitting supplies. The first floor is set apart for storage and shipping space, with adequate provision for office accommodation, while the second and third floors are given over to the manufacturing departments of the Company's business.

The building, the dimensions of which are 280 ft. x 140 ft., is three storeys high, U-shaped in design, so planned as to afford the maximum amount of light throughout the whole premises, regardless of the location of operations on the various floors. The walls throughout are whitewashed, as a solution to the problem of diffused light and so as to provide natural reflection both for day and night operations. The building of the mushroom type, steel and concrete construction, with columns placed 20 feet on centres, there being three sash mullen windows, with four mullens to each bay.

An underground service of 11,000 volts enters the basement of the building through day ducts. After going through the necessary high tension equipment and being transformed with a ratio of 50 to 1, it is carried over $\frac{1}{4}$ in. by 5 in. copper bus, which in turn runs to a main switchboard, located in the engine room 60 ft. away.

The switchboard, photographs of which are reproduced

herewith, is of the latest type, it being 24 ft. long and 14 ft. high and having 70 circuit-breakers. It has in incoming main circuit-breaker and a 3-pole single-throw knife switch through the necessary meters, comprising ammeters, voltmeters, indicating watt meter, and polyphase watt-hour meter. There

Arrangement of feeder distributing conduits

are 21 overload circuit-breakers (No. 983 G1-19, type C, form G. Canadian General Electric Company), with a calibration of 60-150 amperes. The power section of the switchboard has a similar arrangement, with rows of breakers seven side and seven high.

A large pull-box is located at the top of the switchboard,

Special lighting, centre of distribution, and motor starting compensator

Rear view of switchboard, Crane, Ltd., Montreal

with a wiring trough running down back of the board between each set of breakers. This trough conceals the feeders to the different localities within 12 in. of the breakers. Each lighting panel is controlled by individual breakers, regardless of its location in the building, some of the panels being 260 ft. distant from the switchboard. Should any breaker blow out, a bell-ring attachment and red light over each riser of seven breakers convey to the operator the source of the trouble.

The lighting cabinets are also a point of interest. A

View of switchboard, Crane, Ltd., Montreal

wiring space at the back of the slate panels eliminates any possibility of interruption in the service, as circuits may be removed or added at any time, there being a door on each side of the cabinet opening to the wiring space.

The lighting, which is standard throughout the building, is done by a 300-watt No. 5644 Benjamin dome reflector, with mogul socket. Each light is so located that its illumination covers 400 square feet, or 1-1/3 watts a square foot. The ceiling is 14 ft. high and shadows are entirely eliminated, the aim being that the operations of the firm shall be carried on with equal despatch under varying and adverse conditions of outside light.

The installation was made by the Canadian Comstock Company, Limited, according to designs prepared by Messrs. H. S. Stewart and G. F. Reuffin of the Crane Company.

Every job you complete to the satisfaction of your client remains a permanent advertisement for you for many years to come.

At the hearing of the appeals on September 23 it was decided that the city of Montreal should engage Mr. B. J. Arnold, of Chicago, to make an immediate report on the operating and maintenance expenses of the company. The cost is to be borne by the city. A request that the appeals be postponed pending Mr. Arnold's report was refused, the Utilities Commission deciding to proceed with its investigation.

The Laurentide Co., Ltd., Grand'Mere, P.Q., will install three additional grinder units each consisting of a 2800 h.p. motor, direct connected to two grinders. This will increase the capacity of the groundwood department to 400 tons of ground wood per day.

Illumination of a New School at Lennoxville, Que.

To maintain the high standard sought after in the new Lennoxville school, careful consideration was given to all details of both the artificial and natural illumination to create the best working conditions possible for the students. As a guide to the obtaining of the best results, the requirements laid down in the "Code of Lighting for Schools" of the Illuminating Engineering Society of New York were used.

Intensity of Illumination.

In general the following desirable intensities of illumination, as called for in the "Code of Lighting for Schools," were used throughout:

Locality.	Artificial Lighting Foot-Candles.	
Storage spaces	0.5	1.0
Stairways, corridors	1.0	2.5
Gymnasiums	2.0	5.0
Rough shop work	2.0	4.0
Auditoriums, assembly rooms	2.5	4.0
Class rooms, study rooms, libraries, laboratories, blackboards	3.5	6.0
Fine shop work	4.0	8.0
Drafting rooms	6.0	12.0

Main Assembly Hall, Lennoxville School, Lennoxville, Que.

Daylight requirements were figured at least double the above figures for artificial illumination.

Class Rooms.

In all cases the desks were so arranged that the daylight would come from the left side, when the room had windows on one side only, and from the left and back,

when the room had windows on two sides. Window area was figured at least 25 per cent. of the floor area and the ratio of window height to room width not less than one to two.

The artificial lighting is of the semi-indirect type using dense glass bowls fourteen inches in diameter with one 75-watt nitrogen-filled lamp. The fixtures are so spaced as to give a minimum illumination of 4 foot-candles on the desk space tops.

The dense bowls were chosen to eliminate glare and also reflections of the image of the lighted bowl from desk tops, papers or any other reflecting surfaces.

Blackboards are mounted with the tops tilted back which very materially reduces direct reflections of bright areas and therefore writing on them can be read from any position in the room.

The painting and decoration of the class rooms was kept in a light tone and of a matt finish to avoid absorption of light.

Dormitories and the infirmary are lit with identical fixtures to the class rooms the intensity of illumination, however, being lower.

Stair case halls, corridors, lavatories and play rooms are illuminated by means of direct lighting, the fixtures being equipped with dome-shaped Moonstone glass reflectors of a sanitary type to permit of easy cleaning.

Dining Room.

For the artificial lighting of the dining room, a system of direct lighting was adopted on account of the better efficiency and its more pleasing result in producing high lights on the table ware and illuminating the tables to a higher degree than the surrounding walls and the ceiling. The average illumination on the dining tables is 3 foot-candles.

Kitchens.

The fixtures in the kitchens are of the direct lighting type, mounted on the ceiling, equipped with a sanitary type Moonstone reflector. The average illumination is 3 foot-candles.

Assembly Hall.

The main assembly hall has a stage with dressing rooms off, providing for the staging of plays and entertainments. At the back of the hall there is a gallery. The lighting scheme must, therefore, be capable of producing different intensities and light sources must be kept out of view from both the main floor and gallery. The scheme adopted was of the semi-direct type with main central fixtures and wall brackets. The maximum average illumination is 3 foot-candles and the fixtures are so circulated that this may be reduced down to a low intensity when the occasion requires it.

The architect for the school was Mr. Kenneth G. Rea, F.R.I.B.A., and Geo. K. McDougall, the consulting electrical engineer. The Jefferson Glass Co., Limited, supplied the glassware.

Fifty Safety Cars on Lines of the Virginia Railway & Power Company

Twenty "Safety" cars are now in operation in Petersburg, Va., twelve in Norfolk, Va., and eighteen in Richmond, Va. In Norfolk, the cars operate on the Atlantic City-East Main and Brambleton Line, which passes through the very narrow congested streets of Norfolk, including Granby Street, the principal thoroughfare. Formerly this line was operated with seven cars on a ten-minute headway. Now a seven-minute service with ten cars is given. Car mileage has been increased 38 per cent. and the number of revenue passengers has increased approximately 20 per cent.

In Petersburg, Va., the cars are used to replace old single-truck longitudinal-seat cars, with a seating capacity of

24 passengers. With the decreasing soldier traffic from Camp Lee, the density of travel did not warrant an increase in service, so that a car for car replacement was made. The new cars are so convenient and comfortable, however, that a slight increase in travel has resulted.

In Richmond, Va., the cars are operated on the Belmont Avenue and the Laurel Street lines, both of which make the Eighth Street-Main Street-Ninth Street-Broad Street loop which handles the most congested travel in Richmond. Service has been increased on the Belmont Street line approximately 55 per cent., and on the Laurel Avenue line approximately 40 per cent.

On Wednesday, August 6, a test trip was made by the Mayor of Richmond, accompanied by city officials, to investigate whether or not the operation of a street car by one man was hazardous. The car was put through various "stunts" on the level and on some of the 7 per cent. and 8 per cent. grades, and the entire investigating committee, including the Director of Public Safety, were enthusiastic over the car and were convinced that the safety features were designed for every emergency. Director of Public Safety Myers declared that the one-man street car used in Richmond is a "thoroughly safe car" and that the modern appliances with which it is equipped "make it the safest of any car operated by the Virginia Railway & Power Company in the city.

The maximum permissible load in the "Safety" car is placed at fifty passengers, and when the car has this number of passengers aboard, a "Car Full" sign is shown. This is a welcome innovation for the people in the car, and, since very frequent service is given, passengers who are passed up do not complain.

In laying out the Richmond schedules, two methods were used. On the Belmont line runs were laid out so that each operator had a straight run of approximately nine hours without a swing run. On the Laurel Street line, ten-hour and eight-hour runs provided with a two-hour swing for the eight-hour run. The men preferred the latter arrangement for it permitted them to make more money.

In order to decrease the work of the operator as much as possible, the matter of reports is cut down to a minimum. Non-recording fare boxes are used so that the only reports made at the end of a day's run is the time on and off and the register reading upon taking the car and leaving it. The elaborate trip reports have been entirely discarded. A simple form of safety car transfer has been designed which will permit the operator to punch the time before starting from the end of the line and will necessitate only one more punch at the time of issuing the transfer.

The cars are of the standard Birney type, manufactured by the American Car Company, of St. Louis, Mo., are arranged for double-end operation, and a large number are equipped with Westinghouse sleeve-bearing No. 508 motors, type K control, and Westinghouse air brakes.

In preparing the public for this type of service, an educational campaign has been conducted for the past ten months, starting before the cars were even purchased. Full descriptions of the cars, places where they are used, advantages to the public, and other details, have been given in an interesting and instructive manner. This campaign was carried on through the bi-monthly company publication, "Public Service News."

The Sissiboo Pulp & Power Co., Weymouth, N.S., are remodelling their mill, with a view to adding to their output. The electrical power is to be increased, and the S. Morgan Smith Co., of York, Pa., has been awarded the contract for reconstructing the turbines.

Approximate Intensities of Illumination Demanded by the Different Classes of Industry

Industry or class of Service	Intensity in Foot Candles	Watts per Sq. Ft.	
		Small Room	Large Room
Armories	2. to 3.	0.52	0.35
Auditoriums	2. to 3.	0.52	0.35

Calabogie Hydro-electric Development

Plant Constructed on Madawaska River, near Renfrew, Ont., in Seven Months Under Pressure of War Requirements

By A. L. Mudge* and A. R. Whitelaw†

Constructed under war conditions and developed primarily for war purposes, the hydro electric development of the Calabogie Light and Power Company on the Madawaska River, near Renfrew, Ont., is a remarkable achievement in that within seven months from the start power was available. The speed of construction was materially accelerated by the use of equipment already built for another plant but adapted to the requirements of this project with immaterial changes.

The village of Calabogie, Ont., is fourteen miles south of Renfrew on the Kingston and Pembroke branch of the C. P. R. At this point the Madawaska River assumes the proportions of a small lake, at the outlet of which it divides its course into two channels for a distance of approximately one mile. Covering this distance was a series of rapids in both channels, with a total fall of 27 feet from the lake level above. Due to this fall being more concentrated in the south channel, and to the natural topography of the banks offering better opportunity for controlling the river by dams and headworks, it was chosen as the most feasible channel upon which to concentrate the total fall for power purposes.

The general arrangement of the headworks for the control of the river is as follows: At the foot of Lake Calabogie on the north branch of the river, a stop-log sluiceway dam was constructed. This is capable of discharging about half

the maximum flood flow of the river, and can be used as a cut off to divert the full flow of the river to the south channel when required. About one-half mile below the foot of the lake on the south channel, a solid masonry dam diverts the flow to the left through waste or flood sluices and to the right through sluices which control the flow into the forebay. The forebay is sound by the natural topography of the ground on the right and a built-up embankment extending from one end of the solid gravity dam to the wheel-pits on the left. The forebay is about 1,000 feet long by 300 feet wide. The entrance sluices are located about midway in its length and the power house and wheelpits at its lower end. This puts the power house within 150 feet of the low level of the main river. The fact that the natural shoreline of the river formed a back bay immediately below the power house site helped considerably in this arrangement and location. This arrangement required only a very short cut for a tailrace channel to the main river, which was more desirable than locating the power house at the main dam and thus having a longer cut in solid rock to gain the tail water level.

The north branch dam is of five sluices, 20 feet wide with the stop log sill at elevation 495.0 and deck at elevation 510. The south branch main dam is of the solid gravity type, having its base at elevation 470.0 and top at 510. The sluices to the left of the main dam are similar to those on the north channel, with the exception that a concrete spillway was

*Chief electrical engineer, Kerry & Chace, Limited.

†Resident engineer.

Arrangement of headworks for control of river flow. First dam at Calabogie village diverting north branch. Second dam just above power house diverting south branch through a (third) controlling dam at entrance to forebay

added to prevent any undermining effect due to the heavy discharge to the main channel below. The entrance dam to the forebay is also of five sluices, 20 feet wide, but with piers 4 feet in width instead of 6 feet as in the case of the north and south branch sluiceways. The dams are all constructed of concrete masonry. The only reinforcement used was that for anchoring the piers and gravity dam to bed rock. All dams have their foundations on solid rock and no special care was taken with the foundation bed other than the thor-

ing or lowering the gate the total distance in from 5 to 7 minutes. The gantry stands some 40 feet in the air from the deck of the wheel-pits and travels on a track from one wheel-pit opening to the other. Provisions has also been made to assert temporary stoplogs in the openings of the wheel-pits after the steel gate has unwatered the pit. This permits the use of the steel gate in case of forced shut-down of two or more units at the same time.

The turbines are the quadruplex horizontal type, manufactured by the Allis-Chalmers Company of Milwaukee, U.S.A. Each turbine of four runners develops about 2800 h.p. There are two draft tubes per unit, the discharge from the upstream tube being guided to pass the downstream tube on each side by the wedge design of the back of the downstream draft opening. Governors on the main units are the oil pressures type of Allis-Chalmers design. The main bearings of the turbines are lubricated by a non-solidifying grease forced through a piping system from the power house.

The power house is 70 feet long, 44 feet wide and 40 feet high, constructed entirely of reinforced concrete and brick. There is no outstanding feature in its design, other than the

The dam on the north branch of the Madawaska river near Calabogie village viewed from upstream

ough cleaning of the seams between the slab foundations of the rock. This was done by water pressure.

The wheel pits are of the open flume type, each pit being 60 feet long, 23 feet wide and 27 feet in depth, constructed of reinforced concrete. The walls are three feet thick and the whole structure is rendered rigid by heavy tie beams and by the gunnel design of the walls at the bulkhead walls at the top. A heavy application of pitch on wheel-pit side of the bulkhead walls reduced the seepage through to the power house interior considerably and was well worth the expense. Steel trash racks are located immediately in front of the wheel-pit openings and rock area has been provided sufficient to add an additional unit to the plant at a later date. The exciter unit has a separate wheel-pit and stop log control to the right of the main wheel-pits.

A steel gate has been provided to unwater any particular flume on short notice. This gate is hung from and operated by a timber gantry which is of some interest owing to the necessity of constructing it of timber. B. C. fir was used, the main sills, posts and beams being of 12 in. x 12 in. stock. The gate is counter-weighted and the operating mechanism is designed to merely overcome the friction and produce motion by movement of the sprockets over which the chain between the gate and counter-weight travels. The gate weighs approximately 20 tons and a 10 h.p. motor is capable of rais-

Power house, wheel pits and gates under construction

fact that it permits a very compact arrangement of the various equipments and at the same time provides ample room for operation with safety.

A log chute for passing any timber coming down the river was constructed between the power house and the natural high retaining bank of the forebay. The head lock is of mass concrete while the chute itself is of timber. B. C. fir, 12 in. x 12 in. stock, was used for sills and posts, while the bottom and sides were built up of 2 in. x 6 in. hemlock in laminated style. All of this 2 in. x 6 in. stock was salvaged from the former lumber used during construction. This whole framing is supported by rock-filled crib bolted to bed rock. The chute is 12 feet wide at the top and 5 feet wide at the bottom, with flaring sides, and is built to a curve which

A downstream view of main concrete dam and sluiceway on south channel

Upstream view of south channel works—Main dam on the left, control dam at right, showing entrance to forebay

Details of sluiceway dam on north branch of Calabogie river

regulates the velocity in such a way that there is at all points an equal depth of water to float the timber in its course down the chute. This chute has been used a number of times and is highly satisfactory. The chute is also used as a relief for sudden rise in level of the forebay.

Three solid brick houses for the operators have been built on the high land immediately above the power house. These are modern in every respect and are so located that they command an excellent view of the forebay and river above the power house.

In carrying out the construction no heavy equipment was used, other than a couple of derricks and concrete hoists. A railroad siding was built from the station at Calabogie to the power house which facilitated the handling of the heavy permanent equipment. About 18,000 yards of gravel was used and this was of excellent quality for concrete. It was obtained from a pit about three miles from the site of the works. Winter team haul of a large portion of this amount, kept the unit cost per yard within a very reasonable figure. There are no special features of the construction worthy of extensive detail, but the fact that on the first day of May, 1917, not a yard of concrete had been poured for any of the works on the south channel speaks well for the organization management, when the records show the wheels were turning over on November 25th of the same year. It will be remembered that during this period labor was at a premium and delivery of materials very slow so that the construction of this plant was all the more commendable to those in charge.

Of the hydraulic, mechanical and electrical machinery

The south channel works—Main sluiceway and dam at left, control dam at right

entering into the construction of the 6,000 h.p. power house and the 5,000 h.p. Renfrew substation, over 90 per cent. of it was manufactured before the war broke out, although it was not previously in service. This fact meant that a very light demand was made upon our manufacturing resources to obtain the necessary machinery. Incidentally this also meant prompt delivery of equipment. In July, 1917, the engineers promised that power would be delivered in Renfrew by December 1, 1917. On account of the large amount of work left to be done at that time, this statement was received with skepticism in some quarters. However, the wheels were running before the end of November and commercial load was taken over on December 4, 1917, only three days late on an estimate made months before. Since the above date the operating record has been a remarkably good one.

The following are the particulars of power house equipment:

Two quadruplex horizontal turbines, 3,000 h.p. each under 27 ft. head at 164 r.p.m., each with an oil pressure

Details of stop-log sluiceway on south channel

governor. Each turbine drives through a flexible coupling a 2,000 kv.a., 60 cycle, 3 phase, 6,600 volt generator.

One single-runner horizontal turbine 215 h.p. at 350 r.p.m., is controlled by a mechanical governor and drives a 120 kw. 125 volt, compound-wound exciter.

Another exciter generator of the same rating is arranged so that it may be belted to either of the main generators in case of failure of the turbine driven exciter due to ice troubles or otherwise.

All of the above equipment, viz., turbines, governors, generators and exciters were manufactured by the Allis-Chalmers Company of Milwaukee for another customer. However, they were suitable for the hydraulic conditions at Calabogie and were utilized with practically no changes.

The remainder of power house electrical equipment is as follows:

Three 2,000 kv.a. single phase, 60 cycle, oil-filled water-cooled transformers, stepping up from 6,600 volts to 33,000 volts.

Generator, exciter, transformer, and line panels, Tirrill regulator, lead covered cables, electrically operated remote

control oil circuit breakers, H. T. wiring, disconnecting switches, electrolytic lighting arresters, choke coils, etc.

This electrical equipment was all furnished by the Westinghouse Electric & Mfg. Company, who had built it originally to the order of another customer. It had, however, never left the factory until shipped to Calabogie.

The step-up transformers and H. T. switching equipment were designed for 66,000 volts and some slight changes were necessary to adapt them for use at 33,000 volts. This was

Racks and gantry operating gates. Log chute at the right easily and simply done and resulted in securing double the usual factor of safety upon all the high tension equipment.

Besides the above the Moloney Electric Company of Canada furnished three 125 k.v.a., oil filled, self-cooled transformers, 6600 to 110/220 volts for power house lighting and heating and supply of power for motors on the auxiliaries.

A small Ingersoll-Rand compressor was installed for cleaning purposes.

Transmission Lines

The main transmission line is a 33,000 volt, 3 phase line, 14 miles to Renfrew. There are three No. 4 B. & S. hard drawn, bare copper conductors; a telephone circuit of No. 9 B.W.G. galvanized iron and one overhead grounded wire for lightning protection, consisting of one 7-strand galvanized 9/32" cable. An interesting point in connection with this cable is the very simple and inexpensive means used for its support. On all straight runs it is tied to two 3/8" x 5" lag screws driven into the top of the pole. At all corner poles the cable is brought around the outside of the pole and secured by means of an I-bolt Keystone clamp bolted to pole by means of one 5/8" x 5" lag screw.

The high tension line insulators are Canadian Porcelain Company's 2-piece No. 889, and stood a dry flash-over test of 120,000 volts and a test when wet of 100,000 volts.

A 700-foot span at the crossing of Norway Lake was

Stop-log dam at entrance cut

Plan and section of wheel pits and draft tubes

taken care of by double A-frame structures at each end of the span and both H. T. conductors, consisting of stranded copper clad and telephone conductors of 9/32" steel strand, are supported on strain insulators. Overhead grounded wire was not carried across this span.

A 33,000 volt transmission line also runs to the Renfrew Molybdenum Mines at Mount St. Patrick, 15 miles from power house. This also is a three phase line using No. 8, 40% conductivity solid, copper-clad steel wire, which could be used, as total amount of power to be transmitted did not exceed 300 h. p.

The transmission system also included a 6600 volt, 3 phase line, 3 miles to Mr. M. J. O'Brien's farm at Barry-

Turbine runners and casings en route to the plant

vale. Conductors on this line consist of No. 9 B.W.G. galvanized steel, as amount of power to be transmitted was comparatively small.

Renfrew Substation.

The Renfrew Substation is a fireproof brick building with masonry foundation, concrete roof and basement. Into this station comes one 33,000 volt transmission line from Calabogie power house. The station contains three 1667 k.v.a. single phase, oil-filled, General Electric transformers, 30,000 to 6600 volts; these transformers are cooled by forced oil circulation. They were manufactured for the Tallassee Power Company of Badin, N. C., but were never put into service on account of a change in the plans of that company. They were originally built for 60,000 to 12,000 volts and some slight changes were required to adapt them

The power house interior, showing the two generators—Calabogie Light & Power Company

for the operating voltage at Renfrew. This resulted in securing a high factor of safety similar to that obtaining at the power house.

The high tension side of the transformers is protected by a Canadian Westinghouse oil circuit breaker and electrolytic lightning arrester.

A 6600 volt feeder was carried to the British Chemical Company, manufacturing explosives, and all demands for power by this company were supplied from the date of starting of power house until the British Chemical shut down after the signing of the armistice. A 6600 volt feeder also connects with the Renfrew Municipal System and the

entire load of this system has at times been carried by the Calabogie Light & Power Company.

The development described herein is owned and was built by M. J. O'Brien, Limited, Renfrew, Ontario. The following was the engineering staff: Consulting and design engineers, Kerry & Chace, Limited; resident engineer, A. R. Whitelaw; superintendent of construction, F. C. Jewett; engineer of transmission lines, J. B. Harvey; chief electrical engineer, A. L. Mudge; assistant electrical engineer, H. R. McClymont.

The Electric Club of Toronto Opens 1919-20 Season with an Address by Brig-Gen.

C. H. Mitchell

Brig-Gen. Mitchell, D.S.O., C.M.G., received a very enthusiastic reception at the first meeting of the Electric Club, on Friday, Sept. 26, and his talk, which had to do, in the main, with the work of the Intelligence Branch at the front, was of the keenest interest to the large number of electrical men who gathered to hear him. Gen. Mitchell thanked the club for the warmth of their welcome, and expressed his great pleasure at being back in Toronto and in Canada. Having been on the General Staff of the Second Army, engaged in the work of the Intelligence Branch, he pointed out that he was very closely in touch with the employment of electricity in that work at the front. The engineer had filled a very important place in the war and, indeed, it has been said by no less person than Lloyd George that this was an engineers' war. When he went to the other side he had early learned that one who had engineering education was the man who had an advantage over everyone else. Not only was the engineer particularly fitted for military work on account of his technical knowledge, but also by virtue of the habits of mind and the type of development which his training induced. The man who was in the habit of taking a lot of facts, analyzing them, making deductions, and arriving at the decision as to what to do and then putting that decision into effect was the one who was wanted in nearly every branch of an army. Whether it was in technical work, or handling a platoon or a battery of artillery, this was the type of man who came to the top. "I have no intention of disparaging the men of other professions," said the General, "but they were out of their spheres, the medical profession of course being excepted, as their work was in a class by itself. I felt sorry for the lawyer fellow because he was not doing in the war the kind of thing he had been doing at home before the war. You can quite see that the lawyer had nothing similar in his experience, while the engineer, whether commanding a platoon of infantry, or a battery of artillery, or on staff work, had had experience which prepared him for all phases of military operations. He had been accustomed to long hours and had the talent for application and the individual characteristics which go to make up a successful staff officer or a successful officer commanding men.

"In the staff work I could not help but realize how valuable the electrical man or the engineer was, and I always sought, in getting assistants, to secure a man who was trained as an engineer in some form or another and knew he would serve the purpose we wanted. I have in mind one young fellow who came to me in 1917 before the Battle of Messines, and whom I never let go afterwards. He was not particularly brilliant, but had engineering methods of doing things. In connection with the Battle of Flanders when we were working at a scheme for locating the enemy forces beyond Passchendaele and to foresee what the enemy would do to forestall our offensive, it was the greatest pleasure to know that this fellow could go to work and analyze all these various elements which formed the data on which the ultimate decisions were made. Often I went and worked for hours with him, figuring out what the enemy would do if attacked, where he had his reserves and the routes of approach by which he would bring up his supplies.

"With regard to the electrical work at the front, one naturally thinks of its field as concerned chiefly with signal work, but that is only a very small part of it. The telephone service at the front was a magnificent success. Of

course, it was carried on under tremendous difficulties. The signalling apparatus was one of the show places of the Second Army. The telephone exchange was quite as big and had more complicated instruments than there would be in a town or city of 50,000 people. During the Battle of Flanders, there were seven army corps in the Second Army, consisting of 28 divisions, which, along with auxiliaries, brought the number of men up to about three quarters of a million. And all of these had to have telephone and telegraph service. Where quick service was required the telephone was used, and where sure service was required and records had to be kept, the telegraph was used. The normal business at the army telegram stations was 2,000 messages a day. The telephone messages were never counted, but they became so numerous that steps had to be taken to cut them down and priority calls had to be established.

"All the other parts of the Intelligence work applied solely to the enemy. What we had to do was to try and get information of what he was doing or likely to do. The thing above everything else that kept one interested in the work was the tremendous game it was, matching the other side which was trying to get information about you and prevent you getting information about them. It was a great pleasure to think that the fellow on the other side was sitting at his own headquarters about 20 miles behind the lines, just as you were, in about the same kind of a house, with a lot of telephones and staff, under conditions similar to your own. In my spare time, when I had any, I used to wonder what the man behind the German lines was thinking of, for the psychology of the Germans was one of the most interesting things in the war."

Gen. Mitchell proceeded to explain some of the devices which were used for obtaining information, but requested that the details be not published. He also explained the sound ranging apparatus for the location of enemy artillery. Early in the war it had been the practice to place observers in trees, towers or on hill-tops to watch for the flash of the guns, endeavoring to synchronize the observations of a number on one flash and get the triangular determination of the distance by measuring the time between appearance of the flash and the approach of the sound. Even when a gun was down below a hill it was possible to see the "rays" from a flash. It was not long before the French evolved a new method of sound ranging. This was by the use of microphones placed behind the lines on a very long arc. The instrument by which the measuring was done was away back connected by wires with the microphones. The microphone is a combination of a telephone receiver and a cinema. The device can be used in fog or other conditions of poor visibility, but not when the wind is dead against it. Its findings were surprisingly accurate and it was no exaggeration when the sound rangers said they could locate within 25 yards a gun 5,000 or 10,000 yards back.

It was this kind of work, Gen. Mitchell said, that Professor Colborne, of the Toronto University, had been engaged in in Palestine, and he intended to carry out further experiments in connection with it. They also had at the University, Capt. Steele, who was wireless officer for the Canadian Corps, and he also proposed to carry on experiments.

When in Italy, Gen. Mitchell said he had noticed the traction methods used by the Austrians for their big guns. Some of these were 12, 14 or 16 inch howitzers which had to be transported independent of railroads. These very big guns had to be carried in sections, some of them taking as many as six trucks for this purpose. The leading truck had a petrol engine which generated electricity and had

electrical connection with the following trucks, just as in a train of cars, and the power was applied by means of motors on the axles of the trucks.

Gen. Mitchell remarked that he had been very interested to observe the development in electric power plants as compared with what they had been when he had previously visited Italy in 1906. Practically all munition work and war operations were carried on with hydro electric power, for Italy has no fuel within her borders and so must depend on her water powers or on imported fuel. This necessitated the development and extension of existing plant. Unfortunately when the line broke two years ago, one of the largest plants in the Venetian plain was captured by the enemy, and Venice and other important cities were deprived of their power. After the armistice was signed, Gen. Mitchell went to visit these plants, and he said he was much struck with the extent to which they had adopted many things developed on this side of the water. In 1906 they were working along their own lines, but of recent years they had been taking to methods used on the continent, and he saw some things which were the products of our own engineers here in Ontario and in Canada.

Regarding the development of electrical devices and equipment during the war, Gen. Mitchell said if there were another war, which he did not suggest as a probability, Britain would be well equipped for carrying it on and electricity would play a much bigger part even than it had in this war. In the pursuits of peace and the operations of industry, too, the electrical apparatus which had been developed for war purposes, would prove of the greatest advantage and utility.

St. Lawrence Power and Navigation

Preliminaries are under way in connection with the proposed international scheme for the improvement of facilities for navigation on the St. Lawrence River and for the development of the great water powers of that stream. The Canadian and U. S. governments are reported to have agreed to submit the matter to the International Joint Commission for a report upon the feasibility and cost of such an undertaking. To this end, both governments have named representatives, whose duty it will be to prepare the questions to be laid before the International Joint Commission. The U. S. Government has appointed as its representative Lieut.-Col. Chas. Kellar, of the War Department, and the Dominion Government has chosen W. J. Stewart, of Ottawa, the Dominion hydrographer. In the meantime, in anticipation of the investigation, certain surveys have been carried on on behalf of the Dominion Government. The Hydro-electric Power Commission of Ontario, too, has been securing data and preparing plans, according to the recent announcement made by Sir Adam Beck.

Both from the aspect of improved navigation and availability of power, the scheme is of the greatest moment to Canada. If the St. Lawrence waterway were made to conform in depth to the new Welland Ship Canal, which is to have 25 ft. of water, with 30 ft. in the locks, nine-tenths of the seagoing vessels of the present time, it is stated, would be able to steam from the Atlantic to the head of the Great Lakes, and the 300-foot grain carriers which ply on the Upper Lakes and which now can proceed seaward only as far as Port Colborne, the Lake Erie terminus of the Welland Canal, would be able to carry their half-million bushel cargoes to Montreal, there to be discharged into ocean-going ships.

As to the power possibilities, it has been estimated that the flow of the St. Lawrence could generate three million

horsepower of electricity, if not more; as yet a comparatively small proportion of this has been developed. Between Lake Ontario and Cornwall, where the St. Lawrence constitutes the international boundary line, it is estimated that one million horsepower could be delivered for common use in the two countries. The International Joint Commission will be called upon to consider by what method the navigation and power of the river should be developed, whether by canalization of the river channel itself, by the construction of storage dams at two or three points with lock gates, or by a system of canals parallel to the river, similar to, but on a larger scale than the present St. Lawrence canals.

Prosecuting for Theft of Current

A case of interest to electric lighting companies has been argued before Mr. Justice Coderre, in the Superior Court, Montreal. The question is whether the Provincial Government has exceeded its powers in granting to the Montreal Light, Heat & Power Consolidated authority under its charter to prosecute customers for stealing power.

Judge Leet convicted a Montreal merchant for stealing power and fined him \$100. The company prosecuted under its power conferred by Section 26 of its charter, granted by the Provincial Government, the fine going to the company. The merchant asked the Superior Court for a writ of certiorari against the company, his counsel, Mr. Fitch, submitting that the section of the charter under which the prosecution was made was unconstitutional, and for this reason: The charge against his client was virtually that of theft. Theft was a criminal offence and fell under the exclusive jurisdiction of the federal government. The provincial government could not legislate on criminal law; and while it had, of course, the right to give the respondent company its charter, it had no authority to put therein a section giving the company the power to prosecute people in cases of theft.

Counsel, in support of his argument, referred the court to the case of the King vs. Lawrence. In this case it was shown that the province of Ontario passed a Licensing Act and put therein a clause providing that anyone who kept a witness away from giving evidence in any prosecution under the act was guilty of a crime and liable to a penalty of \$50. That section, Mr. Fitch continued, was held by the Supreme Court to be unconstitutional inasmuch as the crime which the section foresaw was in effect subornation to perjury, a crime recognized by the Criminal Code.

"The courts have held," counsel said, "that where the act charged is already a crime within the provisions of the Criminal Code the provincial governments cannot pass any law dealing with it. This legislation belongs exclusively to the federal government. Moreover, it is provided that all men shall be amenable to equal punishment for a similar offence, yet while a man is liable under the Criminal Code to ten years' imprisonment for theft, if he steals power from the company respondent—the crime of theft—he is liable to a fine of not more than \$100. It was never the intention of the law to give two different punishments for the same crime."

Walter R. L. Shanks arguing the case for the respondent company, denied that the offence charged against the petitioner was a crime within the meaning of the Criminal Code. In the instance complained of there had been a violation by the petitioner of the property and civil rights of the respondent company, and it was within the jurisdiction of the provincial legislature to legislate in relation to the imposing of punishment by fine for infraction of the laws of the province made in relation to any matter con-

cerning the incorporation of the companies with provincial objects and property and civil rights.

Mr. Fitch admitted that the company's property rights might have been assailed, but as charged against his client it was the case of theft, and theft was a crime beyond legislative authority of the legislature.

"If," counsel added, "I put my hand in my learned friend's pocket and take his watch he personally is the sufferer because his property has been taken and I am a thief but, according to his argument, if my client steals from his client electric power, that is not a theft. It seems to me the argument will not stand."

Counsel argued that there was a further wrong done to his client in the fact that as the company proceeded it was their inspectors who made the case. They examined the meters and if anything was found wrong it was put right and then complaint entered against defendant. In order to be just, the complaint should be made before the alleged wrong was repaired so that the defendant could test the wrong, whereas when the alleged wrong was removed there could be no test and no fair defence.

Mr. Shanks submitted that in any event the Superior Court had no jurisdiction to issue a writ of certiorari inasmuch as petitioner had a right of appeal before the Court of King's Bench and certiorari proceedings only lay when there was no appeal.

The Wendigo Power Company

The Wendigo Power Company, Limited, has recently been incorporated, with head office at Guelph, Ont., for the purpose of generating and distributing electrical power, and also of taking over certain rights held in trust by Robert Lucy, M.D. The rights consist of a lease from the Ontario Government of the power rights on Wendigo Lake, and certain parts of the Blanche River, and also rights of the storage for power purposes on Wendigo, Skeleton, St. Anthony, Larder and other lakes and streams in the Temiskaming district. The drainage covers some 340 square miles. The company is also authorized to cut and remove timber on parts of the grounds adjoining the development of power and to purchase 190 acres of land through part of which the pipe line will pass and upon which the power house is to be erected.

The location of the plant is in the township of Marter on the East branch of the Blanche River in the District of Temiskaming, about six and a half miles from the town of Englehart, and is in the proximity of a large and active mining area.

The development of 2,000 h.p. will be proceeded with immediately. The necessary funds are available from sale of stock, the estimated cost being \$222,108. It is also the intention of the directors to develop the full capacity of 3,500 to 4,000 h.p. immediately it is required.

The engineers, Messrs. Sutcliffe and Neelands, in their report, estimate the average flow at 270 c.f.s., which, on a 143-ft. head, would give 3,500 h.p. continuous 24-hour load, figuring 80 per cent. efficiency on the wheel shaft. They state that they do not believe the spring freshet run off can be entirely controlled, but that the major portion of the flow can be regulated. Five feet of water on Larder Lake, which has an area of 13 square miles, would hold 65 mile feet; 10 feet on Skeleton Lake, 14 mile feet; 15 feet on Wendigo Lake, 25.5 mile feet; 5 feet on St. Anthony Lake, 12.2 mile feet, and 5 feet on Raven Lake, 12.2 mile feet, or a total available storage of 129 mile feet. Besides that which would be taken care of by the power plant itself when operated to full capacity, they figure that the spring run off would be 176 mile feet.

The engineers have given estimates—one for 2,000 h.p.

development and one for 4,000 h.p. development. In the former instance they figure on a yearly flow of 170 c.f.s., and the latter 270 c.f.s. The figures of the estimate on the 2,000 h.p. development are given below. These costs include the excavation of a head-race through rock, the construction of a gate-house with the necessary locks, gates, etc., and seven foot wood stave flume to the surge tank, which would be of steel construction on a rock and concrete foundation. From the surge tank a separate penstock to each unit is figured on. The power house would have a concrete substructure with frame superstructures, to contain two 2,000 B. h. p. units, or two 1,000 B. h. p. units, according to the extent of the development, those units to be directly connected to electric generators. It will be unnecessary to build any dams unless more than 2,000 h.p. is developed.

Estimate on 2,000 h.p. Development

Item	Cost	Annual Cost
Gate House, Headworks and Head Race (including all rock work)	\$20,000.00	\$ 250.00
Pipe Line A, \$12.00 per foot	72,840.00	3,000.00
Penstocks	1,500.00	60.00
Surge Tanks	18,000.00	600.00
Power House	16,000.00	160.00
Switching	7,000.00	210.00
Tail Race	1,000.00	
Turbines	20,000.00	1,200.00
Generators	25,000.00	1,500.00
Total	\$181,340.00	\$6,980.00
Engineering and Superintendence	\$18,134.00	
Contingencies	18,134.00	
Interest during Construction	4,500.00	
Operation		\$3,500.00
Insurance		6,500.00
Annual Interest on Stock Issue of \$275,000.00 at 10%		27,500.00
Totals	\$222,108.00	\$44,430.00

Or for 2000 h.p. installed at the switch board the capital cost would be \$111.00 per h.p.

If the 3,500 h.p. development were undertaken, this would entail a further expenditure of \$35,000 for the Wendigo dam and \$25,000 for other storage dams, besides increases in the cost of plant and equipment and engineering, bringing the total cost to \$314,005, and the annual cost of \$63,340.

Non-Twist Canopy Ring, Canada, Limited

Non-Twist Canopy Ring, Canada, Limited, has been incorporated to manufacture the non-twist canopy ring and other fixture fittings and parts used in connection with it. According to the prospectus the company has acquired rights which will enable them to establish branches in the United States and England and offices have already been taken at Majestic Building, Detroit, and at 3 Lombard Street, London, England. The directors of the company are: president and general manager, Frank D. Parmenter, who is also the inventor of the device, upon which patents are held by him in Canada, United States and Great Britain; vice-president, E. B. Merrill; secretary-treasurer, Frank Euston; directors, N. L. Martin, C. A.; I. H. Weldon; J. McIntosh Duff, (solicitor).

The company has been capitalized at \$500,000, with equal amounts of preferred and common stock, and a present issue of \$100,000 is being made. The preferred carries a dividend of 8 per cent. cumulative. The company have decided to give a preference in offering the first issue to the electrical trade, in connection with which special terms are being arranged.

Easy Justifying Higher Fares

Mr. W. T. Lynch, general manager, Quebec Railway, Light, Heat & Power Co., has prepared a statement for presentation to the Quebec City Council, in the defence of a request for higher fares, which shows up in a very striking way the increased cost of operation of street railways. Mr. Lynch is asking for a 7-cent cash rate, with 17 tickets for \$1.00, an increase in workmen's ticket and a charge of two cents for transfers. It is proposed to give 11 workmen's tickets for 50 cents. The new scale proposed compares as follows with the existing one:

	Proposed.	Present rate.
Regular	17 for \$1	21 for \$1
Cash	7	6
Workmen	11 for 50c	7 for 25c
Transfer	2c	Free
School Children	Unchanged	

In defense of the advance the company submits figures covering increased costs of operation in various branches, as well as comparisons with other places in Canada and the United States. In the city street railway division the increase in materials in the past six years had been 114.7 per cent.

In the gas division there had been an increase of 127.3 per cent. Among the individual advances in costs were: 65.2 per cent. in anthracite coal; 132.4 per cent. in steam coal; 120 per cent. in cast iron pipe; and 171.4 per cent. in gas oil. Wages showed large advances. In the street railway department they had gone up 46.94 per cent.

One interesting item of costs was a comparison of new cars. The company, it is announced, is installing ten new P.A.Y.E. cars at a total cost of \$185,000; in 1914 the cost per car was \$8,200. These cars will be placed in operation on the system on October 15.

The trophy for the best decorated automobile in the Toronto Labor Day procession was awarded to the Electrical Workers' Union.

Hamilton Lamp Company, Limited

The Hamilton Lamp Company, Limited, have commenced operations in the manufacture of nitrogen-filled tungsten lamps. Their factory is located at 146 York Street, Hamilton. The factory operations are under the management of Mr. D. A. Sprinthal, who has had fifteen years experience in the manufacture of lamps in Canada and the United States. Mr. G. W. Nichol is sales manager of the company.

Steel Reflectors

Adams-Bagnall Electric Company, R. E. T. Pringle, Toronto, Canadian agents, have prepared an interesting catalogue, No. 175, describing and illustrating porcelain-enamelled steel reflector equipment for efficient and economical industrial lighting. The catalogue contains a quantity of useful information including the table of intensities and capacities given elsewhere in this issue.

Safety Frost

The Arts Electrical Company, Troy, N. Y., have placed on the market their "Safety Frost" compound which they claim represents the ideal way of frosting lamps. The operation only requires two minutes and is efficient, clean and permanent.

Seasonal Opportunities

At the first break of chilly weather a few days ago, a Toronto electrical dealer took advantage of the opportunity to push the sale of portable heaters. On a small table in his doorway, on a level with the inside edge of the sidewalk, he placed a glower-type heater, ran the cord in through the door and connected it up. People passing, even though they did not see the heater at a glance, felt the heat of it and instinctively stopped for further examination. Many additional sales can be made by utilizing seasonal opportunities of this kind.

A Notable Installation of Electric Bake Ovens

A most interesting application of electricity to baking is the equipment installed at 300 Yonge Street, Toronto, by the Nut Krust Bakeries, Limited. This is a "cash and carry" business, the extent of which may be judged from the fact that on Saturday, September 20th, 2,328 sales were made over the counter. It is estimated that these sales represented close to 5,000 items. The almost negligible cost, comparatively speaking, of the electric power to operate the ovens for this large number of items may be judged from the further fact that the monthly bill of this company is only \$75, or about \$2.85 per day.

There are three ovens in this store with an electrical

View of Hughes electric ovens in Nut Krust Bakery

capacity of 18 kw. each. Other electrical equipment includes a 3 kw. water heater, 2 proof boxes of 1 kw. each, a 2 kw. stove, a 3 h.p. motor driving a dough mixer, and an exhaust fan. The three ovens were practically working to capacity on the date mentioned above and during the eight hours they were in operation turning out the 5,000 items, required the attention of five bakers. So satisfactory has this equipment proven and so economical in operation that the Nut Krust Bakeries are duplicating these ovens in three other Toronto stores which will be started at the corner of Danforth and Broadview, at Lansdowne and Bloor and at St. Clair and Dufferin. The same equipment will also be

The cost of operation of these electric ovens is almost negligible

installed in St. Catharines, Ontario, where a suitable site has been located. These stores will be in operation before January 1, 1920. Within a year from the present date the manager, Mr. Williams, plans to have twenty-nine of these stores in operation at various points in Ontario.

Mr. Williams is very enthusiastic about his electrical equipment, and claims that the saving in weight is particularly noticeable. While the loss in baking a 1½ lb. loaf, in the ordinary way, is about 2 ounces, Mr. Williams finds that with his electrical fittings the loss is less than 1 ounce. This feature incidentally means that electrically cooked bread will remain fresh much longer than the bread baked in the ordinary way.

The electric equipment used by the Nut Krust Bakeries was supplied by the Hughes Electric Heating Company of Canada. The same company will also supply duplicate equipment to the stores which are to be opened in the near future.

Personals

Mr. Lorne Webster, Montreal, has been selected a director of the Montreal Tramways Company.

Mr. W. A. Landry, B.Sc., formerly with the W. J. O'Leary Co., has joined the staff of the Montreal Armature Works, Ltd.

Mr. A. H. Morse has been appointed managing director of the Marconi Wireless Telegraph Company of Canada, succeeding Mr. Thomas Robb, who is vice-president for the ensuing year.

Mr. George J. Haid, electrical contractor, fixtures and supplies, has just completed new premises at Wellington Street, Preston, and is now in possession. He was previously situated on Queen Street.

Mr. Geo. D. Perry, general manager G. N. W. Telegraph Company of Canada, Toronto, was recently elected president for 1920 of the Old Time Telegraphers' Association which recently met in Cleveland, Ohio, at the 36th annual reunion.

Mr. Merz, the well-known electrical expert, of London, Eng., is now in South Africa for the purpose of investigating the electrification of certain sections of the South African railways and of advising the Government regarding the production of electric power in the Union generally.

Mr. John Davidson, of London, England, acting secretary of the B. C. Electric Railway Company, was a visitor to Vancouver for the first time since 1907. Mr. Davidson is a director of the B. C. Electric Company and managing director of the British Empire Trust Company with which the B. C. Electric Company is allied.

Mr. F. D. Egan, former works manager of the Pittsburgh Iron & Steel Foundries Company, has accepted a position in the general engineering department of the Westinghouse Electric & Manufacturing Company, at East Pittsburgh, where he will devote his entire time to the development of electrical apparatus for steel mill application.

The Chicago Mica Company has recently acquired the services of L. T. Frederick as consulting engineer and production manager. Mr. Frederick was formerly process engineer of the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., and has had a broad experience in the manufacture and application of all lines of electrical insulation.

The Wagner Electric Manufacturing Company, St. Louis, Mo., are distributing an illustrated bulletin on "Single-phase Motors." The application of these motors to various operations is also illustrated and explained. The same company have also just published a bulletin on "Distribution Type Transformers," and this bulletin further contains some useful information on the subject. "Some effects of operating conditions on transformer performance."

The Specialty Shop for Electric Appliances is as Essential as in Other Trades

The competition of the hardware merchant, the plumber, the drug store and the department store may prove the salvation of the electrical trade by forcing the electrical dealer to pursue aggressive tactics.

A walk about the shopping center of nearly any representative Canadian city will convince you that there is room for the small specialty shop. The hat store, the shoe store, the dealer in women's wearing apparel, the jewelry shop, and many others, all prove that the small dealer can successfully compete with the big store. The electrical specialty shop can compete and is now successfully competing with all attempts made by non-electrical stores to enter the electrical merchandising field. For example.

Mrs. Smith has been "sold" an electric fan by national advertising. While walking through Blank Brothers Department Store she sees a special sale of electric fans. She stops and inquires. "This fan is \$7.98; this larger one is \$12.00. Yes, this fan would be very nice for your living room. The blades are solid brass, best black enamel, and a felt covered base so that it won't mar your library table." To her question as to how much current it consumes she gets a vague answer from the saleslady. Mrs. Smith has heard something about "a. c." and "d. c." She doesn't know what it means but has an idea that it concerns fans and other electrical appliances. The saleslady doesn't know either. The name plates state that some fans are a. c. and some d. c., but which to buy is the question. Perhaps Mrs. Smith buys a fan, perhaps she gets the right kind! Frequently she doesn't.

Here is where the electrical specialty shop has the advantage. By judicious use of newspaper and mail advertising Mrs. Smith should be informed that the best place to buy electrical goods is at an electrical shop. Perhaps after her experience in the department store she will be looking for an electrical shop.

Are you doing everything in your power to bring her into your store? If you are bringing her in you are competing successfully with the big merchant.

Individual vs General Service

A big organization with a more or less complicated system of selling, making change, carrying charge accounts, making deliveries, etc., is necessary for the large merchant. Theoretically it results in giving the customer the best service. It does give him the best service that can be hoped for from an organization of great size; but it does not give the customer the same sort of personal, intelligent service that he expects and gets from the small specialty shop. Two examples will illustrate the two kinds of service and will show wherein you in your electrical shop can compete with the large firms.

A man has bought a watch at the jewelry department of a large and progressive department store. Not having the cash with him, he requested that it be delivered c.o.d. to his office across the street. After waiting 24 hours and not receiving the watch, he calls at the jewelry counter and is told that Miss Smith is not there at present and "as she sold you the watch, I cannot tell you exactly where it is now but I will try to find out." The man giving this information starts off in search of an indefinite somebody who

will tell him why the watch has not been delivered. After an impatient wait of perhaps ten minutes the customer is told that "the watch should have been delivered yesterday and I cannot understand why it was not, but Miss Smith will be back shortly and probably she will know about it." The customer has no choice and calls again in about an hour. Miss Smith is there and has gathered about her the heads of various departments. They are all very anxious to please the customer. They tell him again that the watch should have been delivered yesterday, but the fact remains that it has not been delivered. It is some place in the "system"! Where, perhaps someone could tell but that "someone" is not to be found.

Contrast the above with this case. This happened in the shop of a progressive dealer. The only person in the store was a young lady who knew her employer's business thoroughly. A customer came in with an electric iron being a worn out cord. She stated that the iron would not heat. One look at the cord showed the saleslady (who knew her employer's business) what was the trouble. It was the work of seconds to reach into a drawer, find the right kind of a cord with plug already attached, place it on the iron, connect it to an outlet under the counter and show the customer that the iron was heating properly. While making this demonstration the saleslady discovered that the handle of the iron was a little loose. It took but a few seconds more to tighten the handle and return the iron to the customer in perfect condition. The customer paid for the cord and left the shop entirely satisfied.

She had received personal service of the sort which enables the small electric dealer to compete successfully with the big system-bound corporation.

Points to Remember

With the foregoing examples in mind you will yourself discover many ways to make it a pleasure for customers to do their electrical shopping in your store. Here are a few hints. You will be able to amplify these and add many more:

See that your salespeople understand electrical terms and can explain them in simple language.

Don't overlook the good-will value of making minor adjustments and repairs "while you wait."

Never allow a promise to be made unless the salesperson knows that it can be fulfilled.

Wherever possible remember customer's name and use it in addressing her.

Beware the "I use it myself" argument. Some people have a very strong objection to such selling methods.

Feature strongly the slogan "Buy your electric goods at an electrical shop" and then make your electrical shop better than the others.

Be absolutely honest and truthful in all statements.

Don't sell an appliance which you know will not give good service. Better lose a sale than a customer.

Wait on one customer at a time, and give her all your attention.

Avoid employing a salesperson who has an unpleasant voice, appearance or mannerism.

If you are going to have a retail electrical store, don't let it become a workshop.

Keep your wiremen and the wiring end of your business out of sight.

Study your competitors—find out what people like about them and their stores; then go them one better. Find out what people do not like about other stores and avoid those things.

Here are some things customers object to:

1. Dirty floors and showcases.
2. Dingy looking walls.
3. A "forest" of fixtures covering the ceiling.
4. A general look of disorder about the store.
5. Dust covered appliances.
6. Odors of burning insulation, solder, etc., coming from workshop in rear of store.
7. Salesman in his shirt sleeves.
8. Salesman with a cigar in his mouth while waiting on customer.
9. A salesman who talks too much of amperes, volts, resistance, cycles and other technical matters about which the customer is not informed.

Architects' Specifications — As They are and as They Should be

If Mark Twain had been an electrical contractor-dealer, he would have drawn a wealth of material for his humorous writings from the specifications of the average architect. Occasionally he makes a ludicrous attempt to go into details but latterly the architect is becoming more discreet, confining himself to the mere statement that the wiring in the building must be "according to the rules and regulations" of the Hydro Electric Power Commission of Ontario, or other authority, as the case may be.

A case in point recently came under the attention of a certain Ontario contractor. The specifications of the architect for wiring a client's house were prepared on a time worn form of some twenty years ago and were almost meagre enough to be harmless. It was a specification that might have been filled in the ordinary way, if the owner had been less watchful of his own personal interests, for perhaps two hundred dollars, or even a hundred and fifty. The final result of collaboration between the owner and contractor, however, was a very satisfactory equipment, costing about five times that amount, the completeness of which may be judged from the list given below. It is very important to note, however, that the cost of this installation was still well under 3 per cent. of the total cost of the home. Herewith is the complete list of equipment:

Basement.—Nine ceiling lights, 2 snap switches, one of them a 3-way (M.); 2 receptacles (power).

Ground Floor.—Outside front door: 1 light, flush switch. Vestibule: 1 light, flush switch. Hall: 1 ceiling light on 3-way (M.); 1 ceiling on two 3-way. Living Room: 5 side lights, one switch; 5 receptacles (light). Dining Room: 1 ceiling light, 2-point switch; 6 side lights, 3-way switch (M.); 2 receptacles (power). Sun Room: 1 ceiling light, 3-way switch (M.); 3 receptacles (light); 1 receptacle (power). Toilet: 1 ceiling light on flush switch. Passage: 1 ceiling light. Pantry: 1 side light. Kitchen: 1 ceiling light on two 3-ways; 2 receptacles (power). Maid's Room: 1 ceiling light on switch. Refrigerator: 1 ceiling light. Rear Entry: 1 side light.

Second Floor.—Hall: 1 ceiling light on two 3-ways; 1 receptacle (light) (M.). Bedroom No. 1: 1 ceiling light on switch; two receptacles (light); 1 receptacle (power). Bedroom No. 2: 1 ceiling light on switch; 1 receptacle

(light); 1 receptacle (power). Bedroom No. 3: 1 ceiling light on switch; 1 receptacle (light); 1 receptacle (power). Bedroom No. 4: 1 ceiling light on switch; 3 receptacles (light); 1 receptacle (power). Private Bath: 1 ceiling light on switch; 1 receptacle (power). Hallway and Closet: 2 ceiling lights on switch. General Bathroom: 1 ceiling light on switch; 1 receptacle (power). Sitting Room: 1 ceiling light on two 3-way; 2 receptacles (light); 1 receptacle (power).

Attic Storey.—Hall: 1 side light. Bedroom No. 1: 1 ceiling light on snap switch. Bedroom No. 2: 1 ceiling light on snap switch. Bathroom: 1 ceiling light on snap switch. Storeroom: 1 side light.

It is of value to note in connection with this installation that a distinction was made between the base receptacles for light and power. There is an element of danger in using such a small load as the ordinary floor lamp requires on a circuit fused to carry, perhaps, a one or two kilowatt heater. By using different types of receptacles this matter adjusts itself automatically because heavy power load cannot be plugged into lighting receptacles nor light load into power receptacles.

In installing power receptacles, the owner, of course, had in mind that auxiliary electric heating is becoming more general every day. These receptacles are 20 amperes, flush type.

Bell System.

A special bell operated from the front door is placed in the back stairway. A buzzer in the kitchen operates from the dining room floor tread. In addition there is an 8-point annunciator in the kitchen which operates from the sun-room, living room, sitting room, bedroom No. 3, bedroom No. 4, general bathroom, second floor hall and back door.

Telephones.

The telephone lines are run in in conduit and, within the building, connect the pantry, sitting room and No. 4

How to wire for master switch control. M = Master; L, L, = lights; A B, A B, = 3-way switches which ordinarily control the lights

bedroom; the pantry acting as a sort of central point. In the sitting room and bedroom jacks with flush plates are installed and these two points can be signalled by a call bell from the pantry.

Electric Range.

A special circuit direct to the kitchen made provision for a 100 ampere electric range, which has since been installed.

The Master Switch.

A master switch was located in the upper hall and placed about six feet from the floor so as to be well above the ordinary line of switches; it is a rotary (flush) so as to be easily distinguishable from the other switches. Note that the Master Switch controls one light in the laundry (basement) and three on the ground floor (sun room, hall, dining room). A sketch of the master switch connection is given herewith.

How to Handle Electric Appliance Repairs

By C. M. Jamison*

The subject of Appliance Repairs, while one which does not lend itself to spectacular treatment, is, in my opinion, one of the most important components of the successful merchandising of electrical apparatus. It is impossible to treat the subject in the abstract, and do justice to it, by reason of the fact that experience shows it to be so closely allied to general sales policies and having such direct influence on their ultimate success or failure that they must be jointly considered.

Fundamentally, it may be said that the merchant who has successfully solved this perplexing subject will find, as a result, a constantly growing clientele, not alone for his repair department, but for his merchandising department as well, for it is but human nature to patronize the store that with the minimum of inconvenience assists one to a satisfactory solution of the petty annoyances incident to the use of mechanical or electrical devices of whatever nature. An evidence of this fact is to be found in the attention discriminating buyers give to the questions of responsibility of a concern and the service such concern sells with its product. It is safe to say in, for instance, the automobile business, the prosperity of most of our large and successful agents has as its foundation a satisfactory repair and service policy, without which the best car made is but a nuisance.

Get Close to Customers

We are catering to and deriving our existence from utility and labor-saving articles, hence this feature of our business touches directly the daily life of our customers, in consequence of which it is of relatively greater importance than is service to an article used largely for pleasure.

With these remarks on the importance of this prosaic subject, I will now lay before you in a broad way our merchandising policies and will attempt to point out how our appliance repair policies dovetail in.

The problem of merchandising electric current consuming devices is not materially different from that facing merchants of other utility articles, and when we attempt to set ourselves apart and construct special conditions that clash with the accepted and underlying principles of merchandising, we are simply building obstacles in the way of ultimate success.

Methods of Procedure.

With the exception of minor changes to meet the variables in merchandising problems, we probably all proceed in somewhat the following manner:

- (a) We select the articles to be sold from the standpoint of merit and the satisfaction they will give our customers.
- (b) We see to it that in each case we have a sufficient margin of profit to enable us to properly merchandise.
- (c) We then build a sales force which we educate and prepare for its task.
- (d) And then lay out our advertising campaign, with its many ramifications, in such a manner as to produce the results desired.

All that we have done is to create a condition of affairs, which is designed to

- (a) Secure the attention of prospective buyers.
- (b) Induce them to have confidence in us and our employees.

- (c) Educate them as to the merits of our merchandise, the stability of our business, and the satisfaction to be derived from dealing with us.
- (d) Create a desire within them for our goods and our service.
- (e) Secure their will to act and close the transaction.

If this is a fair statement of facts the importance of "service," which of course, includes repairs, becomes immediately apparent. Apply "poor service" to any one of the above and see how it affects the whole.

Do Away With Old Methods

In speaking of our individual efforts in the merchandising field I wish to say that except in one or two instances we are in the merchandising business for profit and to-day have no sympathy for the policies in vogue some years back whereby central stations justified the sale of appliances at a loss, by reason of the fact that they used electric energy. At a certain stage of the development of appliances there was an element of reason in the policy, but it seems to me that the justification lay in gaining impetus for the business and encouraging development work in the shortest possible time, and not in the fact that the article used electric energy—that day has passed and now has come a time when electrical appliances can and should be merchandised at a reasonable profit.

We believe that the maximum distribution of the product can best be had through many sources of supply widely scattered throughout our city and conducting their business on a legitimate and profitable basis.

Our place in such a scheme of affairs is perfectly evident, our merchandising department becomes one of you—a retailer of electrical merchandise—conducted on accepted principles and at a profit. Probably no one of you must work harder than I do to produce such results, and unless I show net profits, I fail in business as inevitably as do you, and in connection with this it must be remembered that of all Milwaukee dealers, my department probably carries the heaviest overhead.

Experience teaches that the more progressive and active is the central station in its merchandising, the greater the progress of all dealers, provided only that the dealers have by honest methods built up a clientele of their own—and it is an accepted principle in our great industry that prosperity, or lack thereof on the part of a central station affects directly and in like measure the prosperity of the thousands in the community served, who depend on the electrical industry for their livelihood.

Attracting Attention.

In merchandising we will use the accepted methods of gaining the attention of prospects—just as our successful department stores use special sales for this purpose. We do likewise and in a measure warranted by our business.

We work for the confidence of our customers and of you gentlemen whose confidence and good will we so earnestly desire. We attempt to educate our customers to the use of appliances and as we are successful in this effort the business in Milwaukee will grow alike for you and for us.

I can best express our conception of the repair problem by saying that as the electrical appliance is a utility article, directly affecting the daily life of the housewife in particular, and every member of the household in general, in order to be satisfactory, it must be reliable, and when out of order it should be promptly and economically repaired.

*Before Milwaukee Convention.

With this as a basis for action, we divide repairs as follows:

- (a) Premises Repairs.
- (b) Shop Repairs.

And these are subdivided as between

- (1) Repairs covered by guarantee.
- (2) Repairs not covered by guarantee.

Under the heading of "Premises Repairs" we class all repairs that can be made efficiently and quickly by our trouble or service men.

Repairs Made on Premises

Palpably it is a waste of time and money, to say nothing of the aggravation caused the customer over the delay, to call in for repair a washing machine in which the only trouble is a slipping belt, a sewing machine motor on which the cork driving wheel has become worn, an iron on which the cord has been broken, probably at the terminal plug, and it is not our intention to do so. When such a condition is developed at the time of complaint, we send a man to the premises capable and equipped to make the repair.

Under the heading, "Shop Repairs" are included all repairs not made on the premises, whether repaired in our own shop or returned to the manufacturer for repair.

Our guarantees conform to the guarantees given by the manufacturers, and when the nature of the trouble permits we make repairs under the guarantee, furnishing labor and calling on the manufacturers for the needed material.

When the needed repair is not covered by guarantee it is handled on the most economical basis that insures satisfaction to the customer.

As an indication that the system is equitable, satisfactory and properly conducted, I might say that our repair department is not only self sustaining, but returns a fair profit after all legitimate charges have been absorbed.

For those who desire more specific information, I set forth the routine of handling the different kinds of repairs. We, of course, have appropriate forms for each transaction. These I simply mention as their exact form is designed to fit in with our theory of internal organization and probably would be of no material value to the average retail establishment.

The form for a repair of this nature is made up by either the clerk receiving complaint or the telephone operator who takes such messages, and gives information necessary for the service man to properly equip himself before calling at the premises. It shows whether or not repair is under guarantee, material used, time spent, and provides space for customer's signature. This form serves as authority bill, when a charge to the customer is in order and at the same time by an appropriate use of stock, charge and credit account numbers clear stock and places profit on the job in its correct place.

In this case the appliances are either brought in by the customer or ordered picked up by our delivery wagons. In the first case a suitable form in quadruplicate is made up by the clerk receiving the article. This form gives substantially the same information as above, and in addition serves as an order on shop to make the repair and for its return to the customer, or to the appliance shop "to be called for," as the case may be.

When it is necessary to pick up the appliance, the same form is used. But No. 1 in such case accompanies the route sheet which goes to the delivery department and has clipped to it a suitable tag in three sections, first section serving as customer's claim check, second section as appliance department record, and third section remaining always attached to the article to be repaired.

When it is found necessary to return an article to the factory for repair, the system set forth for shop repair is followed and in addition a purchase order covering the re-

pair is sent to the factory and charge to customer is made based on our cost, plus transportation.

Always Make Friends

We believe this to be a well balanced system, but in order that it may be effective and secure satisfactory results, both for the customer and the company, all parties to the transaction must recognize the desirability of orderly haste and unfailing courtesy to the customer, for through these we not only repair an appliance, but gain a friend, whose attitude is receptive when some time in the future we say, "let us supply your electrical needs."

Speaking of repairs in general I will say that in my opinion we should use due care in the selection of our stock and see to it that we handle no article not honestly and well constructed, for the sale of poor merchandise invariably reacts in a manner that does permanent injury to a business.

It is our duty to see that where a defect develops in an appliance within the guarantee period, our customer is protected, for he pays for this protection in first cost.

When an appliance which has been in service for a period beyond the guarantee needs repairing, it is our duty and to our interest to see that a workmanlike repair job is done and one as quickly as conditions permit. For such job the customer should pay a reasonable price based on the cost of such job, plus a reasonable profit.

It is well to remember that whenever the public finds the cost of an article out of service, excessive, it will do without, or use a substitute.

The Wagner Electric Manufacturing Company, St. Louis, have issued a very complete and useful bulletin, No. 120, entitled "Manual of Electric Testing." This is a revised edition of a manual published some years ago by the same company.

This illustration shows the illumination at the corner of King and Yonge streets, Toronto, on the occasion of the recent visit of the Prince of Wales. The installation was made by the Earle Electric Company, and consisted of 80 reflectors equipped with 500 watt lamps. The reflectors were Benjamin type and "Abolites." Units were placed approximately 90 feet from the street level and from 8 to 10 feet apart. The conditions on this corner lent themselves admirably to a temporary installation of this sort. Three of the buildings are new and the various flats are equipped with base-board outlets, so that it was only necessary to run the wiring through the buildings and plug into these outlets. The particularly attractive decorations on these buildings showed up as well by night as during the day, owing to this effective system of illumination.

What is New in The Appliance Field

The Carpet Washer

The carpet washer recently demonstrated at various points in Canada, and which will be placed on the Canadian market immediately, we understand, by the Hamilton-Beach Company, of Racine, Wis., was very favorably commented upon by those who saw it in operation. It would appear that the company's claim that all the delicate colors and beautiful shades of your worn carpets are brought back

You can tell it's doing good work by the expression on the lady's face by this washer is as near to being a fact as is humanly possible. It is claimed also that the washing suds used will not injure the most delicate fabric; the special compound prepared under a special formula by this company contains no harmful chemicals or animal fats. For large residences, hotels, public buildings of all kinds, this machine should naturally find a ready market.

Small-Sized "Tungar" Rectifier for Charging Storage Batteries

A small-sized battery charger has been developed by the Canadian General Electric Co. for charging storage batteries from a 115-volt, 60-cycle alternating current circuit. It has been designed especially to meet the requirements of the automobile owner who desires to charge his starting and lighting battery at home or in a private garage. This device will charge 1 three-cell battery at 5 amp., 2 three-cell batteries at 3 amp., 3 three-cell batteries at 1½ amp., 1 six-cell battery at 3 amp.

The essential parts are a transformer for reducing the voltage, and a Tungar bulb, for rectifying the current. Both

are contained in a sheet-metal case. The operation is simple. The device is set on the floor or on the running board of the car, or it is hung on the wall. The direct-current leads are connected to the battery with the spring clips which are provided, and the attaching plug is screwed into a con-

It consists of a small transformer and a rectifying bulb

venient lamp socket. The charging starts immediately. Another sized rectifier of this type which has just been brought out by the same company is designed to be used by automobile dealers and garage owners. It will charge from one to four 3-cell batteries at rates of from 3 amp. to 5 amp.

The Cambridge Rectifier

All makers of storage batteries caution the user against permitting batteries to remain in a discharged condition even though temporarily not in use. All batteries, whether in the motor car, motor boat, laboratory or other service, require frequent charging, and where an automatic means, such as lighting generator in a motor car, is provided, it frequently happens that occasional charging from an additional source of current is necessary.

For such cases, the Cambridge Rectifier fills a useful

For charging batteries at home

need, and an occasional charge for a few hours will keep the battery in prime condition. Where no automatic means of charging is provided, such a rectifier becomes an absolute necessity. Aside from the convenience of always having your battery ready when you want it, you will probably save its cost in longer battery life, in battery rentals and charging fees from service stations.

Storage batteries must be charged on direct current and connected to the source of current so that this current will

flow through the battery in the correct direction, and in one direction only. Unfortunately, practically all public lighting systems furnish only alternating current in which the current rapidly reverses its direction of flow, passing first in one direction and then the other. A storage battery connected to such a source of current would be quickly ruined. The Cambridge rectifier was designed to permit this alternating current to be used safely and economically to charge any battery from this alternating current, which would otherwise be useless for this purpose. The current on entering the rectifier is passed through a transformer to lower its voltage. The current is then conducted through a vibrating reed which oscillates to and fro in unison with changes in direction of the alternating current. On the end of this reed is a contact point which makes contact with another similar point connected to the storage battery whenever the current is flowing in the correct direction to charge the battery, and disconnects the battery from the circuit, when the current is flowing in the wrong direction. Thus impulses flow into the battery in one direction only, and the instrument is so constructed that it automatically charges in the right direction regardless of which direction the battery is connected.

Eliminating Wash Day

The great drudgery of wash day is now being so acutely brought home to every housewife, that both she and the electric dealer are on the "qui vive" for some type of washer which will eliminate the many concealed objectionable features of the old fashioned way and furnish a neat, compact, smooth running, quiet, powerful, efficient, economical, reliable and simple machine of few parts, made of metal, requiring no special wiring, with no wood or metal drums, or insides to remove and clean, free from springs and foot rods

Clothes thrown in form of figure 8

which dig holes in the linoleum or floor; not bulky cobwebby or forbidding, but very attractive in appearance.

The inventor of the Locomotive Electric Washer claims to have this long looked for master-piece mounted in a well braced metal framework sixteen inches wide and four feet long. He says it is the neatest and most compact eight sheet washer conceivable. He has apparently taken a copper clothes boiler, increased the size, changed the shape and with wide brass bands strapped it to a double cast iron V-shaped track running on grooved rollers, two on each side thus carrying the weight, perfectly balanced, of about five buckets of

water which about half fills it. A simple piston action with six inch stroke throws the water twenty-six inches forcing all the suds through all the clothes twice every second in the form of a figure 8. The boiler inside is perfectly smooth with flat bottom under which is located a heater for gas, oil or electric, and the very violent agitation of the water especially if same is heated or boiling, steams, cleanses and sterilizes the clothes with extreme rapidity. The clothes moving slower than the water scarcely touch the walls, and there is complete absence of friction and wear. The wringer can be lifted off and put underneath the machine, an ironing board, fitting snugly, then forms a table top 31 inches high.

The Locomotive Washer comes equipped with quarter h.p. motor, quick detachable reversing safety swinging wringer, ironing board, gas heater and tube, oil or electric burner, copper or galvanized boiler as preferred. It can be driven by gas engine or windmill power and the cost of the motor deducted. The possibilities of using it as a churn and dish washer are apparent. It is fully guaranteed.

The Lyons Electric Company of Brantford, Ont., have contracted for the distributing and manufacturing rights for all Canada, and are now signing up territory.

Mazda Lamp with Tipless Bulb

A Mazda lamp of a new type has just been placed on the market. This is a 50-watt lamp, designated as "C-4." It is similar in every way to the larger Mazda "C" lamps except that it has a tipless bulb of milk-white glass. The bulb is $2\frac{1}{2}$ in. in diameter and $5\frac{1}{8}$ in. long overall. Thus, it is mechanically interchangeable with the 40, 50 and 60-watt lamps. It is made for the 110 to 125-volt range. The diffusing glass of the bulb is of sufficient density to conceal the outline of the filament when viewed from all ordinary distances, yet the light absorption is so low that

Note absence of tip

it gives slightly more light than the clear 50-watt "B" lamp. The glass surface is smooth so that dust collection and cleaning are minimized.

This lamp is particularly adapted to be used where the lamps are exposed or where the glassware does not furnish adequate diffusion. It is also said to be advantageously used with indirect and semi-indirect fixtures, minimizing chain shadows and a sharp cut-off of light and to eliminate objectionable glare from portables and domes, where it is difficult to conceal the lamps; it also reduces the glare reflected by glossy surfaces, such as table tops.

The New E-lite Lighting Fixture

A new fixture called the E-lite has been produced by the Luminous Unit Co., St. Louis, Missouri. This unit, in the opinion of the company, is destined to become most popular for home, school and other such places. The fixture consists of a metal canopy, a white glass reflector 13 in. in diameter, and a white glass or Adam embossed etched cylinder of 6 in. diameter. Contrary to the usual design of such fixtures the lamp is encircled by the cylindrical shade but is

The E-lite

exposed at the bottom, thus providing a certain amount of direct illumination. This feature also prevents dust from collecting in the shade and makes it easier to clean.

It is claimed for this unit that it is aesthetic, utilitarian and attractive—yet economical. It produces a soft tonal illumination and obtains maximum results from the Mazda type C bulb which is used, and its reflector, working in conjunction with the bowl, produces an excellent ray distribution and eliminates shadows. It is furnished in both ceiling and chain design in three sizes for use with 75, 100 or 150 watt lamps.

Transplanted Sunlight

"Transplanted Sunlight" is the name given to a new unit recently placed on the market by the Americolite Company, of New York. This Americolite unit, illustrated herewith, is available for both indirect and semi-indirect lighting and is not dependent upon a specially painted ceiling for diffusion. The reflector, it is claimed, is scientifically curved with reference to the space to be illuminated and

An Americolite unit

types are made suitable for any interior and for ceilings of any height. The disc reflector is very efficient—more so than any ceiling—yet it produces no glare. This unit uses nitrogen lamps and combinations of bowl and reflector are available for all lamp sizes. The unit is designed to be placed high up against the ceiling, which makes it specially suitable for store lighting.

The "Amco" Fixtures

The Art Metal Manufacturing Company, of Cleveland, are entering the Canadian market with their "Amco" industrial, commercial and residential lighting fixtures. The design illustrated herewith is an economical unit for factory lighting. It is really two units in one, combining, it is claimed, the advantages of both the diffusing dome and concentrating deep bowl types of reflector without any of the disadvantages of either. Another unit now being introduced into Canada by this Company is the Amco Illuminet. This is a unit in which the lower half of the lamp bulb forms part of the fixture. The glass globe is made with an open bottom large enough to allow the large portion of the lamp bulb, which is frosted, to fit into it securely. A feature

Two units in one

of the Illuminet is that it can be very readily adapted to any new or old lighting fixture in a moment. No wiring is necessary; it just snaps over any standard lighting socket. The distribution of Amco lighting units will be in charge of Mr. Frank T. Groome.

The Standard Stamping Company

The Standard Stamping Company, Huntington, W. Va., manufacture the useful little table stove, illustrated herewith. This stove includes three distinct cook operations at the same time, such as for example, frying beefsteak, toast and frying potatoes. This is accomplished by the use of

Performs three operations

two elements burning simultaneously. The toasting operation is carried on between the frying of the beefsteak and the potatoes, which means that the toast is browned on both sides at once. For light housekeeping this type of appliance appears to have a very promising future.

A New Westinghouse Radiator

The Canadian Westinghouse Company are distributing this Cozy Glow radiator which they have designed to meet the demand for a heater which will distribute warmth in any direction. Just as the electric fan distributes cooling

The Cozy Glow

breezes about the room wherever desired, so the Cozy Glow throws its welcome warmth. For use in the nursery, and bathroom on chilly mornings; for ticket booths, train cabs, waiting rooms, etc., in addition to general use throughout offices and homes, this radiator is particularly adaptable.

"National" Electric Heating Devices

The National Electric Heating Company, Toronto, are greatly increasing the output of their new "Heatray" and also of their new Toaster Stove. The "Heatray" appliance is shown herewith. It is different in many respects from

The "Heatray"

others on the market, particularly with reference to the cone-shaped heating element which is claimed distributes the heat more economically and improves the appearance. This type of heater is certainly a most attractive and useful appliance for any room in any home.

One of the most useful Polar Cub appliances is the Fountain Mixer. It is made in two designs, for either portable or stationary use. The model shown is the portable mixer. The Polar Cub appliances are distributed by the A. C. Gilbert-Menzies Company, Toronto.

A Household Size Ironing Machine

The Electric Shop, 72 Victoria Street, Toronto, Mr. Geo. J. Beattie, proprietor, is now selling a household ironing machine of Simplex manufacture. This equipment is illustrated herewith. It is claimed that more than 90 per

cent. of the clothes can be done with this machine—everything but actual ruffles. Mr. Beattie is also selling the Walker dishwashing machine, illustrated. The idea in using this machine is that instead of washing the dishes three times a day, you simply scrape them after breakfast and lunch and stack them in the washer. Then after dinner

you pour in water, turn on the motor and everything is washed in a few minutes. After repeating the operation with rinsing water you raise the rack and the dishes dry out ready for putting away. The hot water is dashed up through the dishes and then down again and is claimed to wash perfectly.

The Premier Incandescent Lamp Works, Inc., Union Hill, N. J., announce that they are moving on October 1 to their new plant at 222 Washington Street, Hoboken, N. J., where they will occupy about five times as much floor space as they have had. This company is not quite a year old and has already outgrown 3,500 square feet of floor space. In their new building they will be equipped to make at least 15,000 miniature lamps per day as well as 3,000 standard nitrogen lamps.

Portable Motor for Driving Farm Appliances and Other Small Machines

There are many light machines used about the farm and country home which can be equipped for electric motor drive by substituting a pulley for the hand crank. The washing machine, churn, cream separator, grindstone, forge blower, ice cream freezer, fanning mill and many other devices are adaptable for such operation. In order that it may not be necessary to have a separate motor for each drive, the portable power stand motor shown in the accompanying illustration has been developed by the Robbins & Myers Company, Springfield, Ohio.

For service in connection with low-voltage private farm lighting plants, the outfit consists of a 32-volt, $\frac{1}{4}$ h.p. motor, equipped with a back gear which reduces the motor speed of 1150 r.p.m. to a speed of 285 r.p.m. at the pulley. This speed reduction is provided so that it will not be necessary to use pulleys of excessively large diameters on the mach-

Portable motor for general use on farms

ines to be driven. A three-step pulley is supplied which consists of V-groove pulleys of 4-in. and 3 $\frac{5}{16}$ -in. diameters for $\frac{5}{16}$ -in. round belts and a crown pulley of 2 $\frac{1}{2}$ -in. diameter and 2-in. face for a flat belt.

The motor is mounted on a substantial iron tripod base with rubber caps on the feet to prevent slipping. A brace rod with a clamp attachment to the machine to be driven is provided to keep the belt tight. The rod is telescopic for adjustment of length and also has a swivel adjustment so that the clamp can be turned at any angle. The motor is attached to the tripod by two bolts and when wanted for service without the tripod it can be detached easily by removing these bolts. The motor is furnished with a cord and plug for connection to any lamp socket and is provided with a handle for carrying the outfit.

In addition to the 32-volt direct current outfit for operation on farm lighting plant circuits, the outfit can be supplied with a 110-volt, 60-cycle, single-phase motor for operation on central station circuits.

The Roller-Smith Company, New York, are distributing two new bulletins describing, with illustrations, "Columbia Induction Watt-Hour Meters, for alternating current, switchboard type" and "Electrical Instruments for Signal System Testing, S. S. Type."

An Adjustable Push Button Switch

The adjustable electrolier push button switch now being featured by the Arrow Electric Company, Hartford, Conn., is different from previous types of electrolier switches in that the switch does not have to go through the entire cycle of circuits every time it is operated. This switch, to all effects, is nothing more than a single pole button switch. The black button, however, has a double function, for it not only does its regular work in putting the lights out whenever pushed, but also turns to four rotary positions as desired. By means of the black button, the switch can be adjusted or set on

Performs a double function

any one of four possible combinations of lights, for example, circuit one, or circuit two, or circuit three, or circuits one, and two and three, and operate on that particular circuit by the push buttons as long as desired without bringing in the other circuits. This switch is made in either two or three circuit combinations, and in effect is exactly equivalent to two or three single pole switches, for it permits the lighting of the circuit separately or together as desired. It takes the standard switch plates and boxes and does away with the necessity for gang plates. It allows individual or group control of lights from one point and it saves the necessity of individual switches on each fixture.

Many Uses of Aluminium

The meter case illustrated herewith is of pressed aluminium, manufactured by the British Aluminium Company, 25 Adelaide Street West, Toronto. This company supplies large quantities of aluminium sheet for lamp reflectors, meter

An aluminium meter case

cases and, in connection with domestic appliances, sheet for kitchen table tops, cabinets, etc. We understand that aluminium lamp reflectors are very popular in the Old Country where they are made with a polished outside and a frosted interior which gives a pleasant diffused light. They are very economical to spin and are easily kept clean.

Presto Push and Pull Type Switches

We are showing herewith the very latest Presto product, a push and pull type switch. These switches are made in four different combinations, either single, double, triple or quadruple styles. The switch body parts and plate are made of steel, and all the switch parts are thoroughly insulated. These materials will resist intense heat, and also may be sub-

Made in four different combinations

jected to rough usage. An advantage claimed for this switch is that the holes for the screws in the top plate are farther from the centre than other switches, and the screws will not break away from the wood, because they are not on the ragged edge. All Presto switches are provided with screw terminals and connection bars for the gang switches. The standard finish is black plate with nickel-plated knob; each switch being packed in an individual carton, handy for display and sale.

The Allmur Automatic

The Allmur Automatic Electric Cook Stove is a combination of the fireless cooker and the electric range. For economical operation this is one of the most satisfactory types of stove on the market. The address of the Allmur Manufacturing Company is Marion, Ind.

An electric fireless cooker

For Farm Light and Power

For home and farm lighting and, indeed, for power and illumination requirements at any point where a supply of electric energy is not available from a larger central station, the Lister-Bruston automatic plant has shown itself efficient and entirely satisfactory in operation. Plants are made by this company in various size generators, either direct con-

One of various sized plants

nected to the engine or belt-driven. In the cut shown, the generator is driven by belt. A storage battery also constitutes part of this plant, though not shown in the illustration. The battery is of such a size as to be capable of starting the engine and carrying a proportion of the load without the necessity of using the engine. The automatic features take care of the starting and stopping of the plant, so that a minimum of attendance is required. This plant is handled in Canada by R. A. Lister & Company, Toronto.

Silent Driving Chain Operating Generators

A common and successful application of the "Morse" and "Renold" silent driving chains is in the operation of electric generators, powers ranging from 25 to 5,000 h.p.

The illustrations show a 5,000 h.p. "Morse" silent chain drive from two water wheels to a generator at the Ox-Bow hydro-electric plant, Snake River, Copperfield, U.S.A. The drive is divided into two halves, one half from the shaft of each water wheel unit. Each half consists of four chains of two inch pitch by 21 inches wide, carried by sprockets of 71 and 47 teeth, 91 inches face, and 129 inches center to center. The water wheels operate at 147 r.p.m. and the generator at 225 r.p.m.

Illustration No. 1 shows the generator idle and the left half of the chain drive. Illustration No. 2 shows the generator in operation, one-half of the chain drive being seen

Fig. 1 shows left half of chain drive, generator idle

Fig. 2—Showing right half of chain drive, operating

in the immediate foreground and the other half partly visible to the left of the generator.

This chain drive has been in continuous operation since 1914 without any expense for maintenance. Drives are quiet running, compact, durable and highly efficient. Jones & Glassco, Reg'd., Montreal and Toronto, are Canadian representatives for "Renold" and "Morse" chain, the two largest manufacturers of silent chains in the world.

The Handy Adjusto-Lite

The Adjusto-Lite is one of the handiest things that has appeared on the market for some time. It clamps on anywhere, and, consequently, its uses are legion. It is made in solid brass, three finishes, guaranteed for five years.

It clamps anywhere—shines in any direction

A notable feature about it is that it is universally adjustable, being capable of directing light in any required direction. It is manufactured by S. W. Farber, 141 South Fifth Street, Brooklyn, N. Y.

The Quebec Railway, Light, Heat & Power Co. have ordered ten double truck P.A.Y.E. cars, at a cost of \$185,000, which will be in service in October. The operating expenses of the company continue to increase, and as illustration of this, it may be stated wages have risen 46.94 per cent. for the year ending 31st July last, as compared with the same period in 1914.

At a recent meeting of the ratepayers of Warton, Ont., it was resolved to ask the town council to take steps to cancel the existing contract with the Sauble Falls Light and Power Company and to negotiate with the Hydro Electric Power Commission for a supply of power. The Sauble Falls Company state that there is about \$6,000 outstanding in unpaid accounts which has hindered them, financially, in making certain improvements to their plant.

The "Majestic" Heater—A special model handled exclusively by Nerlich & Co., Toronto

Don't Forget the Young Folks

Dealers must not forget the young people in the home. The use of electric toys is safe and sanitary and many more should be sold than are at the present time. D. C. Hughes

An electrically operated steam engine

& Company, Chicago, manufacture an electric toy steam engine with real power and an electric toy range that cooks and bakes. The toy engine is illustrated. For holiday trade there should be no question that these little appliances will find a ready sale.

The M. Propp Company, 108 Bowery, New York, have added to their lines this year a volt lifter, lamp tester and electric iron replacement plug, all of which are useful accessories.

The Adams-Bagnall Electric Company have prepared a new catalog No. 175, as of date July 1, 1919, which supersedes all previous lists. This catalog deals with porcelain enamel steel reflector equipment for efficient and economical industrial lighting. "Abolites" are distributed by R. E. T. Pringle, Limited, Toronto.

An application will be made by the Winnipeg Electric Railway Company to the Public Utilities Commission for a temporary increase in fares or the elimination of special Sunday rates, workmen's tickets—six for 25c—not to be good on Sundays.

The Bell Telephone Company, Ottawa branch, have opened their new "Sherwood" exchange on Eccles St. About 3900 subscribers were changed over from the "Queen" exchange.

Useful Fixture Connector

A useful fixture connector is sold by the H. D. Sherman Manufacturing Company, Battle Creek, Mich. The screws of this connector, it is claimed, never come out; this saves time and with the price of labor these days time is money. Another feature is that the Sherman connector is made of heavy brass, assuring high conductivity and no

Screws can't come out

rust. These connectors will connect any small wires up to No. 12, with a maximum of two No. 12's solid or three No. 14's in either end.

Ferranti Company in New Home

The Ferranti Electric Co. of Canada have erected a new building on the corner of Strickland and Noble Streets, Toronto. The building consists of three storeys, comprising 10,000 square feet of floor space, all of which will be occupied by the company. The front half of the second floor will be used for offices, the balance of the space being devoted to the building and assembling of transformers and meters. These enlarged quarters have given the company the increased facilities necessary to take care of their expanding business. On the adjoining property a temporary storehouse has been built for storing the stock. It is

The new Ferranti Building

the company's intention next year to build an addition on this property to their present plant, adding probably 20,000 square feet of floor area. Col. George C. Royce, general manager of the company, and Mr. F. W. Rowntree, assistant manager, are very optimistic over business prospects.

The Great West Electric Company, Limited, Winnipeg, have issued an attractive catalogue, designated Catalogue "G," describing electric fixtures and glassware, with illustrations, and including a section devoted to electrical specialties and labor-saving devices for the home. This company have made special arrangements to take care of the demand for 32-volt appliances and fixtures created by dealers handling small lighting plants. This catalogue is of special interest on this account and will be mailed on request to the Great West Electric Company.

The Macbeth-Evans Glass Company, Limited, Toronto, have published an interesting catalogue, No. 82-A, describing and illustrating their line of Thebian ware.

Returned Soldiers Learn Armature Winding

This illustration shows returned soldiers learning electric arc welding, and armature winding on electric motors. The Vocational Branch of the Department of Soldiers' Civil Re-establishment is giving these returned soldiers, who were either minors at the time of enlistment or have been permanently injured in the war, a training in some particular trade for which they seem to be best fitted.

Soldiers at work in Lincoln Electric Exhibit

their educational qualifications and pre-war experience being taken into consideration. Experienced electric welders, as well as experienced armature winders, can command high wages and the time spent in training these men ought therefore to be well worth while.

Magistrate Supports Hydro Inspection Department

On the 23rd inst., before Magistrate Craven, of Stayner, a Toronto wiring contractor was fined \$450.00 and costs for violating two of the Commission's wiring inspection regulations. This is the largest and heaviest fine which has been imposed to date for violation of the Commission's rules and shows conclusively that the magistrates of this province fully realize the necessity and advisability of backing up the Commission's Inspection Department in its endeavor to carry out the Rules and Regulations which have been adopted by the Commission for the prevention of fire and accident.

We understand that the contractor in question received plenty of warning and it is obviously part of his business to know that the Commission intends to enforce the Regulations which they have made and which are now the law of this province. There is no doubt that the best of the wiring contracting element in Ontario will commend Magistrate Craven for dealing severely with the matter and will realize that the Commission in enforcing its laws regarding inspection is safeguarding not only the wiring business but the general public. We trust this fine will serve for all time as a warning to itinerant wiremen and others that they had better take out permits in future.

The Harold Electric Repair Company has recently opened premises at 66 John Street, Toronto, for repairing of motors, generators, etc.

Standardizing The Outdoor Substation

By Mr. H. W. Young*

While practically every outdoor sub-station is special in that local requirements must be met, yet a very complete standardization of elements has resulted in a sub-station design which is practically standard for a large percentage of installations. The development of unit type elements such as switches, choke coils, fuse mountings, lightning arresters, bus bar supports and steel tower sections, permits special assemblies to meet actual conditions. For example the switching and protective equipment can by means of adjustable fittings be secured in various positions on the tower, or at different spacings or heights. The supporting tower is made in sections which can be erected to secure sufficient ground space for transformers of different capacities or dimensions. The bus bar supports can be clamped as desired on the steel frame, thus securing the most advantageous spacing or clearances of bus wires. This flexibility in arrangement of standard unit type elements is of great convenience to the transmission company as it

Unit Type, 450 kv.a., 33000 Volt, Outdoor Sub-station

eliminates the expense of delay always incident to securing a special equipment.

The installation shown is a typical example of unit type elements assembled to meet a special condition. In this case the purchaser wished to have the lightning arrester mounted near ground level rather than on the tower. This condition was easy to meet by using separately mounted arresters, locating them on a 1-1/4" pipe frame. To enable isolating these arresters for complete adjustment or inspection, three standard disconnecting switches were bolted to channels fastened to the tower corner poles. The transformer bus wires were suspended between standard dead end insulators of the same type used for attaching incoming line wires to the steel tower. The three pole air break switch is of interlocked type with operating handle at ground level, thus permitting all three poles of the switch to be simultaneously opened and closed.

*President, Delta-Star Electric Company.

Current News and Notes

Brighton, Ont.

The farmers in Brighton township are desirous of securing Hydro power and have instructed the clerk to ask the Commission for plans and estimates.

Chatham, Ont.

It is reported that the city of Chatham, Ont., will take over the electrical business of the Chatham Gas Company.

The Bell Telephone Company have taken out a permit for a new office and exchange building on Sixth Street, to be opened some time during the coming summer.

Kitchener, Ont.

The special committee of the City Council and Light Commission, appointed to confer with President W. H. Breithaupt, of the Waterloo-Wellington Railway, has decided to recommend that no action be taken on the offer of the company to lease their Bridgeport line to the city for 12 per cent. of the gross receipts. The committee, however, will recommend that the railway be purchased by the city provided a satisfactory price, based on the earning power of the road, can be agreed upon.

Montreal, Que.

The Minemax Electric & Manufacturing Company, Montreal, (T. W. F. Cleaver and P. Marazza), have registered.

Peterboro, Ont.

Mr. P. Alexander has retired from the firm of Alexander and Miller, electrical contractors, Peterboro, Ont. Mr. J. H. Miller, who has been a partner for eighteen years, will continue in association with Mr. G. R. Powell and Mr. G. H. Watson, who have been connected with the firm for a number of years. The store will be known in future as "The Electric Shop" and the firm name will be Miller, Powell and Watson.

St. Stephen, N. B.

The New Brunswick Public Utilities Commission, in joint meeting with the Public Utilities Commission of Maine, recently granted the street railway company, operating in St. Stephen and Calais, permission to use the seven-cent fare and the right to issue books of eight tickets for fifty cents.

Swan River, Man.

The municipal board of Swan River, Man., will shortly call tenders for an electric power and light plant.

Toronto, Ont.

Employees on the Toronto Civic Railways have been granted an increase in wages and now receive the same rate as that paid by the Toronto Railway Company.

The Toronto Hydro-Electric System will proceed with the installation of an electric lighting system in the Woodbine Heights district in the township of York.

Plans have been prepared for an extension of the Toronto Civic Car lines from the corner of St. Clair and Yonge Streets to the city limits via the Mount Pleasant Road. The cost of the line is estimated at slightly under a million dollars.

Uxbridge, Ont.

The town of Uxbridge now enjoys the distinction of having the highest domestic lighting rate on the continent. The charge was originally 10 cents per kw.h. with discount. Some months ago the plant was taken over by the municipality and the rates are now 20 cents per kw.h. plus meter rental and no discount.

Giving a Taste of Electric Service

The Indiana Power & Water Company, at Vincennes, Indiana, is using a novel scheme to overcome the lethargy of owners of homes not now wired for electricity. Where the cost of complete wiring of an old house for electric lights appears too excessive to the owner, the Power Company offers to install what they call their "service board," on which are mounted a key socket and lamp, a rosette with ten feet of drop cord, and

a flush receptacle into which may be plugged an iron or similar heating device. The board is furnished complete with meter and an electric iron for \$7.45

The advantage of this scheme is the low cost at which some of the immediate advantages of electric power can be obtained, and the elimination of the confusion which sometimes goes along with the wiring of an old house. Once one of these service boards is installed, say in the kitchen of the house, it becomes a silent salesman for the electrical idea, and is therefore an entering wedge to a complete wiring of the house. Further than this, in the case of rented houses, where the owner will not put in wiring but the renter desires it, the latter gets the advantages of the electric power, and can take his service board with him when he moves, with the assurance that the Power Company will serve him at his new location.—"Contact."

GUELPH, ^{Limited} - CANADA

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

"American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$3.00.

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price \$2.00.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price \$2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price \$1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price \$2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price \$2.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Electric Power Transmission, Principles & Calculation, by Alfred Still. 2nd Edition, revised, enlarged and rewritten. Just published by McGraw-Hill Book Co., Inc. 407 pages, illustrated. Price \$3.50.

Elements of The Infinitesimal Calculus, by G. H. Chandler, M.A., Prof. Applied Mathematics, McGill University, 318 pages, cloth bound. Published by John Wiley & Sons, 1907. Price \$1.40.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price \$1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price \$1.50.

Examples in Alternating Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$2.00.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price \$1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

"Fuel," by C. F. Herington, recently published by D. Van Nostrand Co. 211 pages, with 84 illustrations. Price \$3.00.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

Induction Coils in Theory and Practice, by Prof. F. E. Austin. Published this year by the author. 64 pages, illustrated. Price \$1.00.

International Library of Technology, Vol. 11.B, on Electricity and Magnetism, Electrodynamics, Electrical Resistance and Capacity, The Magnetic Circuit, Electromagnetic Induction, Chemistry and Electro-Chemistry, Primary Batteries, Electrical Measurements, 585 pages, fully illustrated,

half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

International Library of Technology, Volume 14-C on Storage Batteries, Incandescent Lighting, Arc Lighting, Interior Wiring, Modern Electric Lighting Devices, Electric Signs, Electric Heating, 540 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

"Powdered Coal as a Fuel," by C. F. Herington, recently published by D. VanNostrand Co. 211 pages with 84 illustrations. Price \$3.00.

Practical Electric Illumination, by Terrell Croft. First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.50.

Standard Wiring, 1919 Edition, 25th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price \$1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price \$2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price \$1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.

The B.I. Hand-Book, published by British Insulated & Helsby Cables, Limited. Second edition. 448 pages, illustrated. Price \$1.00.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price \$2.50.

"The New Competition," by Arthur Jerome Eddy, 6th revised edition, price \$1.60.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price \$1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price \$1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.50.

ELECTRICAL NEWS,

347 Adelaide St. W., Toronto, Ontario

SAFETY FROST

Non-injurious to the skin, non-inflammable and absolutely permanent.

Easy to apply—Simply dip into can and allow excess to drip back for two minutes, and wash off with water.

Is not affected by weather or heat of lamp. It is on to stay.

Automatic Electric Lighting
and Pumping Installation

Protected by Patents

Gives electric service, the equal of that enjoyed in the city, to country homes and hotels, small towns, bungalows, clubs, churches, schools, etc.

Installations are in regular use all through the Dominion, and we have abundant testimony from users of their great efficiency.

Very simple and reliable of operation, requiring no skilled attention.

Absolutely Automatic—Starts Itself—Stops Itself

Canadian Distributors

JAMES DEVONSHIRE, LTD.

701 Yonge Street,

Toronto

**Give It
the
Oil
Test**

**Spaulding
HARD FIBRE**

Soak a sheet, rod or tube of Spaulding Hard Fibre in oil. Prove for yourself that oil will not penetrate this dense, horn-like material.

Unlike rawhide, leather and hard rubber, Spaulding Hard Fibre is impervious to oil, making it an ideal material for parts which are likely to become covered with oil.

Physical Properties

Its electro rupture is 200-400 volts per 1/1000 in. of thickness; tensile strength 10,000-20,000 lbs. per square inch; compressing point, 38,000-42,000 lbs. per square inch; shearing strength, 9,000-13,000 lbs. per square inch. It can be machined, sawed, stamped, bent, threaded, drilled and finished in many attractive ways.

Made in red, black and grey colors. Send for samples. Our Specialty Department is equipped to machine special parts to your own specification.

How To Get Lighting Glassware

**when all goods
are so scarce**

Fulfilling your needs these days is a problem that may frequently tax your ingenuity as a buyer.

Never before has lighting glassware been so scarce, so difficult to obtain.

We are ready to aid you to the utmost. In our stock, ready for immediate shipment, are ample supplies of

Pendants and Bowls

Simply tell us your Requirements

Your needs in pendants or bowls—opal, crystal or Cora—plain, etched or hand decorated—and the approximate price.

We will answer immediately just what we have, its price and full information.

If you wish the goods, wire your acceptance at our expense. The very next day the lighting glassware you wish is safely on its way to you.

It means prompt service in times when any service is scarce.

May we help you? Write today.

Manufacturers

**The Duncan Electrical
Company, Limited**

MONTREAL - CANADA

LINCOLN

ELECTRIC ARC WELDERS

have paid for themselves and more, in Railroad and Boiler Shops, Bridge Works and Shipbuilding Plants, Steel and Malleable Iron Foundries.

They have also been successful with Mining Companies, and manufacturers of Agricultural Implements, Safes, Conveying Machinery, Drop Forgings, Automobiles, Tanks, Pressed Steel, etc.

We operate a shop in Toronto for demonstration purposes and to handle all classes of repair work in the shop or outside.

MOTORS

Our stock of 25 cycle 550 volt

New Lincoln Motors

has been pretty well depleted on recent orders, but new shipments are on the way and we aim to keep motors of the following H. P. and speed in stock:

$\frac{1}{2}$, 1, 2, 3, 5, $7\frac{1}{2}$, 10, 15 at 750 and 1500 R.P.M.
20, 25, 30, 35 at 750 R.P.M.

The following is a list of used and odd sizes on hand:

	H. P.	R. P. M.	Cycle	Volt	Make
1	1	750	25	550	C. G. E.
1	10	1500	25	550	Westinghouse
1	25	750	25	550	Westinghouse
1	25	750	25	550	C. G. E.
1	30	750	25	750	Westinghouse
1	35	750	25	750	Westinghouse
1	2	1800	60	220	Lincoln
1	5	1800	60	220	"
1	5	1200	60	220	"
1	30	1200	60	220	"
1	1	1800	60	550	"
2	2	1200	60	550	"
2	3	1800	60	550	"
3	$7\frac{1}{2}$	1200	60	550	"
1	15	1200	60	550	"
2	50	900	60	550	"
2	75	900	60	550	"
1	100	900	60	550	"

"Profit Savers"

on every job of interior wiring

Phantom View

Walger 3-Way

Use it to tap feed wires in outlet boxes, Conduits, and on knob and cleat work. It is the quick easy way.

Actual Size

Walger Connectors

A quick easy way to cut your connection costs—use Walgers. Just loosen the cap and turn back the screws—it is only work of a minute.

Eliminates blow torch, solder and tape. Walger simplicity makes it the quickest, the easiest, the safest of any type of connection.

Once in place the Walger takes a sure grip, and every connection is perfectly insulated. Cuts your connection cost right in half.

Approved

by the National Board of Fire Underwriters and the Hydro Electric Power Commission for No. 12 and all smaller wire.

Send for Sample To-day

The minute you get a Walger in your hand you will see for yourself just how it will save. In these days of high prices here is an economy worth while.

Walger 2-Way

Wherever there are connections to make on any interior job you can do them easier, quicker, and cheaper with Walger Connectors.

and Engineering Review**
TORONTO - MONTREAL - WINNIPEG - VANCOUVER

ECONOMY renewable FUSES

are the *right* fuses to protect *your* electrical circuits—

- because they afford the right sort of protection; their reputation lends assurance that you can safely depend on them for accuracy of rating and all-round efficiency in operation.
- because they cut annual fuse maintenance costs 80% as compared with the use of one-time fuses, owing to the fact that an inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.
- because it's the work of a moment to replace the link and renew the fuse.
- because a good sized stock of "Drop Out" Renewal Links always on hand represents but a small outlay.

UNIVERSAL BUSHINGS FOR FLEXIBLE TUBING

Neat, Secure and Accessible

Nos. 1 & 3

They grip the flexible tubing securely. Can be installed in a moment by simply slipping over the tubing. Fits "knock out" tightly. Permits easy removal of flexible tubing for inspection without dismantling switch box or injuring bushing or tubing.

Nos. 2 & 4

Universal Bushings

combine function of porcelain, bushing and tape, and give the job a finished mechanical appearance. Try them and be convinced.

Approved by the National Board of Fire Underwriters

Laying STANDARD Steel-Tape-Armored Cable across a Street.

A 50 Per Cent. Saving

in the cost of installing underground electric cables is worth considering these days. A cable which can be laid directly in a trench in the ground without conduits may solve the installation problem before you.

STANDARD Steel-Tape-Armored Cables

are designed for this class of service, and have in many cases shown a 50 per cent. saving in installation cost as compared with single runs of lead-covered cables laid in conduits. Write for bulletin 680, which gives complete information.

Montreal Hamilton Winnipeg Seattle

"Just What I Want"

This is exactly what you, or any one else, will say after having bothered around with loose extension cords.

The Automatic Extension Reel

for Electric Lamps

Obviates the necessity of dragging your cord over the floor, thus wearing out insulation and breaking sockets, guards, etc. Takes your light just where you want it, locks at any point, and automatically rewinds your cord when you are through with light. Contains 25 feet of approved reinforced weatherproof cord.

Approved by the Underwriters, and endorsed by fire and electrical bureaus everywhere. Fully protected by two basic patents and more pending. Write for further particulars and prices.

ESTABLISHED 1849
BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamilton,
Ont.; London, Ont.; Montreal, Que.; Ottawa,
Ont.; Quebec, Que.; St. John, N.B.; Toronto,
Ont.; Vancouver, B.C.; Victoria, B.C.; Win-
nipeg, Man.; Calgary, Alta.; Edmonton, Alta.;
Sydney, N.S.

THOS. IRVING,
Man. Western Canada, Toronto.

**This SOLENOID SWITCH has been adopted
by the Hydro Electric Commission**

**They use it for
STREET LIGHTING**

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment, by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

Generation, Transmission and Application of Electricity

Wagner, Quality

Alternating Current Motors

The First
Thing
To Start—
The Last
To Stop

They are as dependable as time, the heart of your shop. They are built by engineers with twenty-five years of Wagner experience behind them. If lineage counts for anything, Wagner motors should receive your first consideration.

Eliminate chance in your production, at least as far as power is concerned. There are Wagner, Quality motors that will exactly fulfill your requirements if your current service is alternating. Then why not assure yourself of continuous, profitable power by specifying Wagner, Quality motors. Send for Bulletins 11713 and 11813.

Formation of LINCOLN METER CO.

LIMITED

in October, 1918

PAUL M. LINCOLN, President

S. L. B. LINES, Manager

THE Company was formed for the development of the maximum demand meter based on the heat principle as developed by Paul M. Lincoln of Pittsburgh, Pa.

Although the Company has been in existence for a period of over twelve months, no publicity has been made use of, it being the policy of the management to have the meter ready for delivery before making any announcement.

Above is a cut showing the meter.

MADE IN CANADA

LINCOLN METER CO. LTD.

243 College Street, TORONTO, Canada

Telegraphic Address: "Meters," Toronto.

The Meter of Merit

Write to us—the manufacturers—to-day for particulars.

*British Material
Canadian Workmanship*

The C. & H. Meters have long held the premier position for their accuracy, simplicity and scientifically correct construction.

Besides being absolutely the best instruments you can install for reliability, they represent a combination of Canadian and British production. With the war ended many of the obstacles of obtaining raw material from Britain have been removed, and we are now in a position to make old time prompt delivery.

A Time and Labor Saving Screw for Electrical Contractors

Robertson *Patented* Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

The P. L. Robertson Mfg. Co., Limited

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Accurate—Rugged—Inexpensive

In factory or field, the Type S set will quickly and accurately measure resistance or locate faults. It will withstand, without detriment to its electrical qualities, the knocks which such a set is bound to get. It is of the Dial Decade Type, and therefore simple to operate.

Excellent design plus quantity production enables a low price without sacrificing accuracy—ratio coils 1/20 per cent, rheostat coils 1/10 per cent guaranteed.

The removable suspended coil galvanometer deflects a millimeter per microampere. This combination—accuracy of adjustment of coils, sensitivity of indicator, ruggedness, inexpensiveness—is found only in the Type S set.

PRICE \$75.00

Simplify Emergency and Routine with O-B Cam Tips

Speed where an emergency repair must be made with the least interference to traffic.
Simplicity when darkness complicates routine maintenance.

Thoroughness all the time. It is so easy to install O-B Cam Tip devices that there is no temptation to say "That's good enough" and leave the job half done.

After they are on, O-B Cam Tips provide a smooth arc-reducing approach. This tough bronze stands heavy service. And when the time does come, the tips are easily renewed.

The Ohio Brass Company
MANSFIELD, OHIO

O-B Type E Live Crossover. Adjustable from 30° to 90°. Deflectors furnished for 30° to 60°.

O-B Type F Insulated Crossover. Adjustable from 45° to 90°.

O-B Type D Frog, suitable for moderate speeds and all general city service.

O-B ER Live Rigid Crossover (not illustrated) is similar to Type E. Made in 8°, 15°, 23°, 33°, 35°, 37°, and 90° angles.

Besides O-B Frogs and Crossovers you can get O-B Strain Plates and Section Insulators with Cam Tips.

O-B Type E Frog, adapted for high speed service and for use where several types of cars are operated over same line.

Attracting Buyers

to the store of the dealer has been an important branch of our national advertising. That it has been tremendously successful is evidenced in the remarkable increase in sales of

EDISON MAZDA TUNGSTEN LAMPS

Are you participating in this success? There is profit, prestige and regular custom to be obtained in featuring Edison Mazda Lamps. You couldn't sell an article with a better reputation, and we stand ready to aid you in attracting this profitable business to your store.

Write us today.

The Hall-Mark of Quality

The long standing reputation of C.G.E. Electrical Goods is a valuable asset to the Electrical Dealer.

It should be borne in mind that first cost is soon forgotten, but satisfactory service never.

C. G. E. Electrical Appliances are sold on a quality basis. Each one sells another.

This famous line comprises a wide

variety of Electric Cooking and Heating Devices, every one of which is designed to fill a distinct need in the home.

C. G. E. Electrical Goods have come to be looked upon as criterions in their respective fields. It is because of this that we say, they are the "Hall-Mark" of good quality among electrical appliances.

Christmas, 1919 will be "Electrical." Are you preparing?

Universal Insulator Supports

SAVE
Time, Labor and Material

UNIVERSAL INSULATOR SUPPORTS are specially designed malleable iron clamps made in four sizes for securing Insulators to open steel framework for wiring mills, foundries, shops, bridges, piers, elevated railways, subways, train sheds—and similar structures. They are easily attached, and by their use, electric wiring for lights, motors, generators, cranes, etc., can be installed with a great saving of labor and material.

REDMANOL

Perfect Moulded Insulation

for example :

Radiator Caps

Makers of fine motor cars are quick to recognize Redmanol superiority for special parts. The radiator cap on their car is in a position where it can't but be seen. In addition to downright service-ability, the cap must possess good looks. Naturally, then, they chose Redmanol.

Our laboratory is anxious to solve manufacturers' problems. Ask us.

Redmanol Qualities

Resistance to extreme heat.
Exceptionally high dielectric strength.
Great mechanical strength.
Excellent acid resistance.
Unusual accuracy of dimensions.
Singular beauty of finish.

"THREE E" CLAMP Insulator Supports

The accompanying illustration shows an installation of Three E Clamp Insulator Supports, carrying the generator leads from turbine, through vault, to switchboard gallery of a large power station. The advantages of this type of construction is all open wiring and all leads easily accessible.

Clamp Insulator Supports are made for all size cables 5/16" to 3" diameter and for pipe or flat mounting.

FRANKLIN

BUS BAR SUPPORTS

THERE are three ways to make a Bus Bar Support. One way you have security-plus, two ways you have a dangerous weakness at a critical point. Here are the facts:—

One method is to cement the fitting to porcelain moulded with recesses to receive and hold the cement. Under expansion and contraction, this cement cracks and loosens or the porcelain cracks. But a broken insulator is unsafe.

Another method is to clamp the fitting to the porcelain. This puts an initial strain on the porcelain and because all porcelain is irregular in contour, spot pressure is unavoidable. This often cracks the porcelain, and a broken insulator is unsafe.

The third method is the process which makes the Franklin Post Type Insulator mechanically perfect. The metal bushings are actually die-cast onto the porcelain, intimately fitting every irregularity—an absolute union of metal to porcelain. Then these bushings are machined and threaded to receive the fittings.

This patented feature of Franklin Bus Bar Supports is a guarantee of permanent security. The absence of clamp screws avoids these points of possible static discharge. And there are other features of refinement and superiority. Which do you want in your plant? The safest? Then—"Install the Franklin and forget it."

The Gilbert B84 Polar Cub Vibrator

B84 Polar Cub Vibrator
Retail \$9.60

This item will make a splendid Christmas Gift and should be stocked by every electrical house in Canada.

It is a complete Vibrator with three rubber appliances for different kinds of massage. Has thumb switch on handle. Motor is the universal Polar Cub, fitted with cord and plug ready to attach to electric light switch. Operates on either direct or alternating current 105 to 120 voltage.

N.B.—This appliance is for home use and is not built for barbers' trade. For home use it is guaranteed for one year.

While on the subject of Christmas lines, remember we make all kinds of Electrical Toys, Toy Electrical Sets, Wireless Sets, Toy Motors, Transformers, Phono Sets, Telephone Sets, etc., etc.

LOCOMOTIVE Electric Washer

THINK what it means to the housewives of Canada—to you as a sales proposition. The Locomotive Washer is neat, compact, smooth running, quiet, powerful, efficient, economical, reliable and simple, made of all metal, requiring no special wiring.

The Locomotive Washer is attractive in appearance. It is easily moved about. There are no metal or wooden drums to remove or clean; no springs or foot rods to dig holes in the linoleum or floor. Well braced metal frame work sixteen inches wide, four feet long and thirty-one inches high; an oblong copper boiler eight sheet capacity; reversible safety swinging wringer can be lifted off and put underneath. Close fitting ironing board then forms a table top. These, with a quarter h.p. motor, a gas heater and tube, or oil burner, and copper boiler form the standard.

A galvanized boiler costs less—an electric burner more.

Records Which Make Sales for the Dealer who Handles R & M Motors

Where records are kept of motor performance, there is where the dealer who sells R & M Motors finds his warmest supporters.

The absolute reliability of these motors, their ability to handle overloads when necessary and their uniform high efficiency as shown in black and white on the records, make it easy for dealers to get repeat motor business in plants where they have previously installed one or more R & M Motors.

Dealers who supply R & M Motors find it

pays to suggest to their new customers that they keep records on the performance of the motors in their plants so they will know definitely which motors have given the best service when they are in the market for additional motors. If this is done the dealer can depend upon R & M Reliability to do its work for him.

Just as users find maximum satisfaction in R & M Motor performance, so do dealers find maximum profit in selling the motor which can always be depended upon to make good for them and their customers on a reliability basis.

No. 20

Ignorance and Prejudice a Poor Combination

A member of the Board which is making investigations into the present cost of various manufactured products, during the cross examination of a well known Toronto jobber, is reported to have remarked that he had always looked upon the jobber as an unnecessary factor in business. What bearing this remark had on the question at issue was not evident but it indicated, nevertheless, an entirely inadequate knowledge of the various steps in merchandising. Without such knowledge the present investigation is doomed to failure. Where ignorance and prejudice are found in the same judge, however, the situation loses interest even for the public.

We hold no brief for the jobber any more than for any other link in our industrial life. He exists today, we imagine, for the same reason that manufacturers and retailers exist—to supply a demand. There are three distinct links in the chain—(1) the manufacturer makes the equipment, (2) the jobber or the wholesaler takes it off his hands and distributes it to the retailer and, (3) the retailer passes it out to the consumer. A manufacturer may also perform the function of a jobber, but that does not alter the fact of the jobber's existence. The commissioner seemed to have a sort of hazy idea that the jobber's profit was an "extra." Did he ever stop to ask himself why the average manufacturer doesn't do his own jobbing and keep this extra profit himself? If he had the logical answer must have suggested itself to him at once—the jobber can per-

form this function of distributor cheaper than the manufacturer can. Why? Because he specializes on distribution.

This Board seems to forget that the country is watching the action of its members pretty closely. Stupidity and prejudice will make them no friends. The public have a shrewd idea just about where and to what extent profiteering has been carried on—all they lack are the facts and it was to gather facts this Board was appointed. Personal opinions, under such circumstances, are better suppressed.

Unfair Attitude of Public

One of the curiosities of the interminable controversies over the higher cost of living and the universal rise in all commodities has been the attitude of many public bodies to the demands of public utility companies for increased revenue. While it cannot be denied that the cost of operating and maintaining street railways, for instance, has risen—yet the request for more revenue to meet these conditions has been met with vigorous protests, and at the same time the companies have been denounced in vitriolic terms if the service is curtailed or is not maintained up to the accustomed standard. A notable example of this inconsistent attitude has occurred in Montreal, where owing to higher wages the Tramways Commission has been compelled to issue a higher schedule of fares. The claims of the men were of course supported by the labor organizations, but when these claims compelled additions to the fares, the Commission was fiercely attacked by a labor organization for adopting the only method by which the increased wages can be paid. It was declared to be an injustice to the working classes, who, according to this argument, want low fares and high wages. That way spells bankruptcy.

The city of Montreal appealed to the Quebec Utility Commission against the proposed fare increases, and called in Mr. James R. Bibbins, assistant chief engineer of B. J. Arnold & Co., Chicago, who, instead of supporting the case for the city, expressed the opinion that there is no justification for reducing the estimates of the Commission for this year, and no chance of lowering the fares fixed by that body. The time was too restricted for a thorough examination of the system, but he made some suggestions which he believes will ultimately result in more economical operation. For instance, he is of opinion that there should be efforts made to standardize power plant and equipment, which will take time, and also to eliminate many stops. He emphasized the fact that rush hour service is the most expensive, giving a number of reasons, chiefly because of continuous fixed charges on equipment used only at certain times. The cost of power to deal with this rush traffic is also necessarily high. An important fact in relation to the cost of maintenance and renewals was also brought out. While the quantity of work done in 1918 was only about 80 per cent. of work done in 1913, the cost was over 120 per cent. higher than in 1913, due to increased costs. Mr. Bibbin favored free transfers and opposed the zone system.

The position taken by the company is that the budget is not sufficient, and that an average fare of 6.6 cents should be allowed instead of 5.9 cents suggested by the Tramways Commission. The result of adhering to the Commission's estimates will be a deficit of a million dollars, in addition to the \$1,300,000 already incurred, and unless still higher fares are granted a larger deficit will occur every succeeding year. The company is not interested in the distribution of the burden of additional income, but in securing sufficient revenue to meet all obligations.

The Montreal Tramways Co. admittedly give one of the best services on the Continent, and if they are denied an adequate income, owing to low fares, will not be able to maintain an efficient service, and the public will thus suffer.

An Engineer's Opinion of Ottawa Conference

At the luncheon of The Electrical Club of Toronto on Friday, Oct. 3, Mr. Frank R. Ewart, of the firm of Ewart and Jacob, consulting electrical engineers, gave an interesting address, summing up his impressions of the National Industrial Conference recently held at Ottawa. Mr. Ewart was chosen by the Toronto Section of the American Institute of Electrical Engineers to represent the viewpoint of the technical electrical man at the Conference, as one of the "third" or neutral group. In this third group were a number of engineers.

At the outset, Mr. Ewart said, it became evident to him that the Conference was more or less in the nature of a contest, but the antagonistic attitude seemed to disappear about the end of the third day and thereafter there was a feeling of greater openness and friendliness. Labor was out for legislation; it was their apparent belief that the cure for all the ills of this country was legislation ad lib., while it seemed to the speaker that if the labor men could have got eighty representative employers to whole-heartedly agree with them in the matter of wages and industrial relations, there would be no need for legislation. The original attitude of the employers appeared to be very much "stand-pat," their chief argument being "This is not the time." This argument, however, was silenced by a labor man who pointed out that the employers had used it on every occasion when a progressive suggestion was brought forward.

The main points of contention were the eight-hour day, collective bargaining and recognition of unions, and on these questions no agreement was reached. In the matter of joint councils, the employers and the employees got closer to an agreement, though they favored different types of councils. The labor leaders wanted the Whitley plan, which is based on recognition of the unions.

An outstanding feature of the conference was the relative debating methods and skill of the two parties. The labor delegates all had something to say and advanced arguments on behalf of their proposals which were certainly definite and clear-cut and well-expressed, while the employers' efforts, outside of a few excellent speeches on the part of some of the leaders, showed up poorly by comparison.

M. Ewart pointed out that commissions, boards and bureaus had been recommended to deal with many questions brought up at the conference, but its real value would be the effect it might have on the minds of some 200 delegates and the impression they received of the other fellow.

Courtesy—No Investment Required, Returns Are Amazing

Men,—hundreds of them, yes thousands have longed for an opportunity to "show,"—for the chance to get somewhere in the game of salesmanship. They finally get the chance, the opportunity. They are drilled by their managers,—lectured at meetings, collectively and individually. Then how do they measure up? Not all, but a large per cent., something like the following:

Late one night on a train leaving for the South, I chanced to make the acquaintance of a gentleman from my home city. During our conversation he inquired as to what business I was interested in. This information I gave him, whereupon he casually went on to say that his wife had had a vacuum cleaner out at his home on trial only about two weeks before.

He went on to say what a wonderful device an electric cleaner is and how thoroughly he was sold on such devices for lightening the work of his wife around the home. During our talk on the subject he informed me that had the salesman been just half civil and shown the least amount of courtesy

to his wife that she would have purchased the cleaner from him. As a result, of his lack of judgment, she ordered him out of the house.

The cleaner was sent back,—not because the work it accomplished was unsatisfactory, not because the price was too high,—not because she was a "joy rider" as some salesmen are wont to term some prospects, but because the salesman forgot that he was doing the selling—not the buying. Lack of courtesy and his willingness to quarrel lost him that sale. His lack of commonsense lost him his commission and the office the profit on the sale. And more, he made an enemy of a woman who really wanted to purchase a cleaner. What her comments will be to her friends, we can just imagine, but we are dead sure they won't be favorable.

I inquired of my new acquaintance as to the make of the cleaner he had tried. When he told me that it had been the machine manufactured by my own firm, my estimation of the salesmen dropped a good fifty per cent. I apologized for the salesman and explained the best I could what we were up against in the way of salesmen.

Immediately upon arrival at the Branch Office in the morning I looked back over the records of demonstrations and learned the salesman's name who had been out on that prospect. Sure enough, the demonstration card had been marked, "J. R.-ng," meaning, joy rider, no good.

The point is, that the salesman who had made this particular demonstration was a man who we've spent many hours with,—one who we've tried to take more than a passing interest in,—one who has had the opportunity to sit in on sales meetings and gather valuable information and instruction. In fact, he is better than the average as far as the closing of sales is concerned, but his fatal error, his mistake 'is, his willingness to "fight" prospective customers. Courtesy doesn't mean any more to him than milk does to a fish. It is his own undoing,—it will forever keep him back, and he, like a great many other salesmen, will wake up and realize some day when it is too late, when opportunity has slipped by, that more flies are caught by molasses than by vinegar.

To be courteous, pleasing, accommodating, costs a salesman nothing. The average woman expects courtesy. She confers the favor in purchasing, not the salesman or the person he sells.

More sales are lost by retail salesmen because of their snippiness, their willingness to "fight" prospective purchasers, and their lack of courteousness than because of any lack of knowledge of the article they are selling.

All the sales meetings that can be held, all the books on salesmanship that have or can be written are as worthless as glasses on a blind man, if the one attribute, courtesy, is pushed to the back ground by snippiness and sarcasm.

Courtesy,—it gets the salesman the orders and costs him nothing. Be a dispenser of it and in many a tight pinch it'll "bring home the bacon" when the technical points are like so much water on a duck's back.—From Eureka "Volume and Velocity."

Inspected Shawinigan Properties

A party of members of the Senate, at the invitation of Senator Smeaton White, on October 4 visited Shawinigan and Grand'Mere, P. Q., and inspected the plants of the Shawinigan Water & Power & Allied Companies. Members of the party spoke in terms of high appreciation of the development in generating power and in the electro-chemical industries. The object of the visit was to demonstrate the enormous progress which has been made in power development as related to industries and also to make members of the Senate better acquainted with the growth in the pulp and paper industries.

The Viewpoint of "The Man on the Street"

Public Utilities are at all Times on Trial Before the Court of Public Opinion.
A Splendid Address Before the N. E. L. Association

—By S. M. Kennedy*

If there is any class of business which is at all times on trial before the great court of public opinion it is that of the Public Utility Corporation. The establishments of the merchant, the manufacturer and other industries are operated from eight to ten hours daily—on the working days only—but the central station company must be ready to supply instant service day and night, week-days and Sundays, feast days and fast days, high-days and holidays. The jury is in constant session taking cognizance of the evidence which is being given, and be the testimony good or bad, honest or dishonest, worthy or unworthy, no item is overlooked when the times arrives to review, sum up and render a verdict. The utility company cannot select its jurors as they are selected by the opposing attorneys in a trial in court. Its jurors are selected by the destiny that groups men together in cities and communities. These jurors may not be challenged, but must be accepted with all the bias or prejudice they may bring to the trial. Consequently it may be the part of wisdom for the heads of public utility organizations to study the jurors—to analyze and diagnose any causes for suspicion, prejudice and opposition to the end that the evidence may be so influenced and directed by liberal policies and enlightened management that the verdict may be a source of every day satisfaction. Certain conditions surrounding the operation of a public utility's business are fixed and cannot be altered, and such being the case, operation should be so adjusted that these conditions may be recognized, and, if possible, used to advantage. It is as advisable for a corporation to be philosophical when dealing with the inevitable, as it is for individual—both may well agree with James Whitcomb Riley:

"It ain't no use to grumble and complain,
It's just as cheap and easy to rejoice;
When God sorts out the weather and sends rain,
Why—rain's my choice!"

It is probably safe to say that three-fourths of the mistakes that the Central Station man makes in his intercourse with the public are made because he does not really know the things he thinks he knows. If the Central Station is constantly on trial, had it not better keep its eye on the juror and if possible get his viewpoint. There was a time when it was thought the juror could be ignored—that he had to take what was given him and be quiet—but now things are different. A Russian proverb says: "Time does not bow to you, you must bow to time." Today it is perhaps better to bow alike to time and the juror and take them both into consideration. The juror can only be fixed by some one obtaining his viewpoint—that is, by the corporation man looking at the business from the outside, or as it is seen by the Man in the Street.

The Man in the Street is a many sided individual in some respects, but in the main he will be found reasonable, tractable and not unfriendly. In my efforts to illustrate the different angles of observation from which the Man in the Street looks inward at your business, I will endeavor to develop five sides of his character. It will be distinctly understood that I am not advising anyone how to change or conduct his business. Long ago I learned it is permissible to express an opinion—but advice should be sent by

slow freight. The Man in the Street has some advantages not possessed by the man inside, and the man on the inside can well afford to listen if the man on the outside has anything to say. The five angles from which the Man in the Street will here be considered are (1) The Impressionist, (2) The Student, (3) The Human Being, (4) The Customer and (5) The Investor.

The Impressionist.

It has been truly said that trifles make perfection, but perfection is no trifle. As an impressionist, the Man in the Street is either consciously or subconsciously influenced by what appear to be trifles. Daily as he proceeds on his way he observes the properties and employees of the Central Station. Do they impress him favorably or do they irritate him? What pleases him and why? When is he jarred and for what reason? As he looks along the principal streets in his town do the pole lines impress him as being clean-cut and regular? Are the poles located in the least objectionable places and are the services run with any regard to appearance? Sometimes he sees lines that appeal even to a layman as being carefully planned and excellently constructed. Sometimes he observes that a street or highway is needlessly disfigured by irregular poles, ragged wires and sloppy construction. Don't imagine these conditions are not observed by the Man in the Street. They speak for themselves and later on, if they are not remedied or made less objectionable, the Man in the Street is liable to make a noise which will sound to the Central Station like having to spend a lot of money for removal of such lines or maybe the installation of underground construction in their place. How about the stations, sub-stations, warehouses and garages? Do they always present a creditable appearance? Could the grounds around them be kept more tidy and would some needed repairs or a coat of paint on some buildings make a better impression? The Man in the Street misses nothing. He knows whether you are properly maintaining your property or allowing it to degenerate. If objectionable conditions continue without improvement, he may charitably conclude you are in a rut, and he knows that the only difference between a rut and the grave is in its dimensions.

The Man in the Street has business in your office occasionally. Is it an up-to-date office, with an open, inviting appearance, or is it one of the old, forbidding type, with high railings, with little windows for the clerks to look through at customers and the customers must stand off and meekly take whatever may be handed them. A pleasant, cheerful office is an invitation to come again, and no one realizes it more than the Man in the Street. Are the clerks neatly dressed—the men with clean clothes and clean-shaven faces, and the women in such costumes and colors as befit their work. Is the Manager easily accessible or is he locked in behind a closed door where he cannot see his assistants and where the company's customers cannot see him? High railings, dark partitions and closed doors impress the Man in the Street as belonging to ways that are dark and secrets that are deep. Open offices invite him to inspect and he is liable to say to himself that an invitation to inspect implies that there is nothing to conceal.

I have heard some men say, "What does it matter to the Man in the Street how we maintain our property? We

*General Agent Southern California Edison Company.

get no more revenue from him if our lines are straight or crooked, our buildings and property tidy or dirty and our offices inviting or the reverse! He gets the service just the same." There is the great mistake. You are part of the community in which he lives and takes a pride. Your methods either help the community or hurt it. If your methods please him, he will ultimately take more liberally of your service, and your income will be correspondingly greater. The impressionist-side of the Man in the Street is one that should be regarded as highly important and not to be slightly ignored or carelessly overlooked.

The Student.

The one thing that is most frequently overlooked in connection with the Central Station business is that the company is distributing an intangible commodity. The purchaser does not see what he is buying, as is the case with ordinary merchandise. He cannot tell when he pays his bills that he is paying only for what he has received. His senses, which are useful in buying some things, do not help him in his purchases of electricity. Under conditions like these, something must be relied upon to take the place of the senses and the only substitute is confidence. Now the average Man in the Street wants to know just where he is at when spending his money, and the Central Station Company should make it easy for him to learn all that is possible concerning the real facts surrounding the production and distribution of electricity. The Man in the Street will study conditions and reach his own conclusions about your business. If the truth is spread before him for thoughtful inspection, his conclusions are liable to be favorable. If, however, he becomes saturated with mis-information concerning the methods and aims of the Central Station, then his ideas will be perverted and his attitude prejudiced. The Man in the Street is reasonable and willing that a company giving good service should receive a fair return on its investment. However, in a reasonable manner he must be shown what is the investment and what constitutes a fair return thereon.

Perhaps there is nothing more important for the Man in the Street to study than the subject of what is good service and how it may be obtained. If he is a lighting consumer he ought to be informed as to the difference between ordinary light and scientific illumination. He should be advised that he may often have better lighting at less cost, by using more modern methods. If he is a power consumer his installation should be inspected and where conditions indicate wasteful consumption, the way should be pointed toward more economical operation. He should be instructed that when he has troubles with his service he should tell them to the company and not to his neighbor. He should know what department of the company to communicate with and what is the telephone number.

Does the Man in the Street know that all rates for service are subject to approval by the State Public Utility Commission? Does he know that these rates are ordered or approved only after exhaustive investigations made by the Commission's experts as to the company's actual investment, operating expenses, and depreciation charges, and are calculated to yield only a small return on the capital invested? Does he know that the Central Station Company cannot raise a rate or increase a charge without an order from the utility commission after a public hearing has been held? Does he know that in fixing rates the utility commission does not consider the company's bonded indebtedness or outstanding capital stock as a basis for calculating what should be the company's net earnings? Does he know that the Central Station Company cannot issue any securities without the approval of the utility commission, and that the company must show how every dollar derived from the

sale of securities is to be spent? Does he know that the return the company is allowed to earn on its investment is not sufficient to provide for extensions and betterments, and that for such purposes new money must come from the sale of the company's securities to investors? Does the Man in the Street know that if he has a grievance against the company he may make a complaint to the utility commission, and his trouble will be thoroughly investigated? These are matters for the Man in the Street to study. At times they mystify and bother him, but the more he learns regarding public regulation, the more he is liable to esteem the utility commission, respect the company and be satisfied that his individual interests are fully protected. With a proper understanding of public regulation the Man in the Street has a better grasp of the economic law of natural monopoly. As a student, he may well consider some chapters from the records of disaster that are written in the history of many cities and towns in America where rival utility companies have attempted to operate in the same field, where that field is properly served by one company at reasonable rates. His study will develop that unfair competitive conditions are ultimately disadvantageous to the consumer, who by increased rates must inevitably pay for the destruction caused by unnecessary competition. All publicity of misinformation should be counteracted by even greater publicity of true conditions. Truth is mighty and if the Man in the Street may study and grasp its meaning he will eventually become a defender of the Central Station and an ardent advocate of its service.

The Human Being.

Quite recently the manager of one of the districts operated by a large utility company in this state received a letter from a consumer reading as follows:

"Ordinarily when we pay an account promptly, we feel we have fulfilled our obligation, but in your cases we are moved to something more, and the purpose of this letter is to thank you for the businesslike manner in which our transactions with your company have been handled. Furthermore, we have enjoyed that indefinite 'something' which goes with your service, and which makes it a pleasure to do business with you."

The Man in the Street is a human being and that indefinable "something" referred to is a recognition of the tactful, attentive courtesy displayed to him as an individual. This attribute attracts new consumers, and makes the older ones feel at ease and satisfied. It is, in fact, the open sesame to the public good will, without which no company can continue to be successfully operated. The rulings and orders of utility commissions may govern the quality, manufacture and distribution of a commodity, but they do not stipulate what shall be the attitude to the individual consumer. That is left to the management.

The Man in the Street dislikes to be herded—he hates to be known as one of so many thousand consumers a company may have in a community. He likes to be considered as an individual, and if he is known by his name, he likes it better still.

From my own residence I have occasion to send quite a few long distance messages over the telephone. There are two Long Distance Companies, and heretofore I have always been prejudiced in favor of the older company. When I ask for Long Distance, the routine is, "Number, please? Your own number? Your name?" Recently, at certain hours of the day, a new operator is on my line at the office of the other company. I have never seen her and do not know her name. When she says, "Number, please?" I may say, "10621." When she says, "Your own number," I say, "571-W," and then instead of saying "Name, please?" she says, "Oh, yes, Mr. Kennedy." Now, I am the Man in

the Street. I like my individuality recognized, and because of that girl's tact, my business seems to be gravitating to her company.

Much of the criticism directed against Utility Companies might be dispelled or relieved by a broad-minded policy in handling complaints, in which each case is treated as an opportunity for acquaintanceship with the consumer and each complaint is given an individuality, by impartial and critical investigation. A complaint is an opportunity to make a friend, and the opportunity is with the individual in particular and not with the class of complaint in general. To satisfy means to hold business that probably was difficult and costly to get. To satisfy means the keeping of old friends and the making of new ones—and friends build up a business. In handling complaints, words are only one means of expression and manner is quite as important; a kindly and courteous manner is not only the sign and mark of a self-respecting man, but it is to words what oil is to machinery in making them move effectively to their purpose. The Man in the Street gives many opportunities for Utility Company employees to know him and please him. Perhaps no opportunity occurs more frequently than in the payment of bills. He probably calls at your office for this purpose once a month. If he makes such a call, pays his money and has his receipt handed him without word or recognition from the employee, he misses something and an opportunity for the company has been lost. If the next time he calls the clerk says "Thanks" when handing the receipt he feels a slight recognition of his existence. If on a third call the clerk says "Thank you" he feels more interested and if on the fourth call to pay money there should be a clerk with tact enough to see the name on the bill, and when returning the receipt to say "Thank you, Mr. Jones," the Man in the Street goes out with an appreciative smile, and the thought in his mind that he is known as a consumer and recognized as an individual. Too much importance cannot be placed upon the treatment of the Man in the Street as an individual who appreciates all the niceties in the relations of one human being to another, and above all he appreciates—

"How sweet and gracious, even in common speech,
Is that fine sense which men call Courtesy!
Wholesome as air and genial as the light,
Welcome in every clime as breath of flowers,
It transmutes aliens into trusting friends,
And gives its owner passport round the globe."

The Customer.

Some years ago in a certain Western city where there were three electric companies competing for business, a new theater was in course of construction. The three companies had identical rates for serving so that element did not enter into the competitive conditions. Mr. X, the business manager of Company "A," was watching the situation closely, and became somewhat discouraged when the report was brought to him that the owner of the new building was a stockholder in Company "B" and naturally would influence the lessee to sign with Company "B." Another report he received was that there existed a racial affiliation between one of the directors of company "C" and the lessee of the theater, and that Company "C" was sure to get the business. The lessee lived in a city several hundred miles distant. One evening as the manager of company "A" was about to close his desk, the office door opened and a stranger walked in. He asked the manager if he were Mr. X, and receiving a reply in the affirmative, he stated he was the lessee of the new People's Theater and wished to arrange for service. He explained to Manager X that there had been much influence used to swing his business elsewhere, but that men in the theatrical business had a way of in-

quiring from each other about certain matters. He had inquired from other theater managers as to which company gave the best service, and Manager X was informed that not only the theater men receiving service from his company, but others in the city all agreed that Company "A" gave the finest service, and looked after its customers in the most satisfactory manner. The Man in the Street listens, inquires and uses his own judgment when he is going to give his business, and your record for attention to the little things in service may often win you big revenue producing contracts.

A central station plant ought to be loaded twenty-four hours daily. It does not have to sleep. The load curve ought to be a straight line, before the electrical consumption of any community has reached the saturation point. New consumers are desirable, but the development of increased business with existing customers is still more desirable. For greater business from present investment we must cultivate the Man in the Street. It may be considered an axiom that no consumer is using as much as he could take to his own advantage, and the most profitable business is produced by inducing consumers to increase the number of uses of electricity. Much time and money have been spent in the past in an endeavor to clip a small percentage from the cost of manufacturing and delivering a kilowatt-hour. Economies of operation are to be commended, but the time has passed when it is simply a question of jumping a set of service wires to the consumer's premises, and dumping a few kilowatt-hours there each month. The time has come when it is up to us to interest ourselves more than ever before in the manner and method of using our product on the consumer's premises, so that the greatest possible economies and benefits may be secured.

The Man in the Street knows of no saturation point, neither should we. The Man in the Street is willing that the annual consumption per capita should increase year by year if he is benefitted thereby. It is up to us to show him that electricity and convenience are synonymous and in what direction new benefits may be obtained. There is no limit to intensive development of this kind—but it cannot be obtained by wishing and waiting. The point upon which this whole question of business development hangs is the ability to let the people know—in other words, to create the desire. The Man in the Street must be informed so that he may be fully advised as to the possibilities of electric service in the lightening of labor and in adding comfort and good cheer to the life of mankind. He is already in a receptive condition and is only waiting to be shown the wonderful capacity of electric energy in performing almost everything within the range of industrial and commercial life. All we need is men who have a thorough practical and intimate knowledge of the possibilities in the use of electric service. The possession of this knowledge fills them with confidence and enthusiasm, so that when they talk to the Man in the Street, the battle is as good as won. Obstacles are swept aside, objections are over-ruled, competitions are annihilated and, by-and-by, the Man in the Street, far from being saturated, will, like Oliver Twist, only ask for more.

The Investor.

The problem as to the future of public utility companies is one which occupies considerable attention in the public mind to-day, and is one which is of vital importance to the utility company and the public. There is a competition going on between public control and private ownership. Public control is attractive to many, but even its friends acknowledge that because of certain inherent conditions it must travel a long way before it reaches success. Private ownership has pioneered, nursed and developed the business, and the same qualifications which have produced so much good

work in the past should enable it to continue and progress in the future. There is a greater need for co-operation between the utility company and the consumer than ever before. But co-operation is a matter of give as well as take. Sometimes it amounts to doing the other fellow's way when he won't do ours. The Man in the Street is thinking as he never did before—he looks at the utility company and believes it is prosperous. Why should he not share in its prosperity? Some wise man has said the best way to conserve private ownership is to increase the number of private owners. Who is brave enough to say that it is not the answer to the problem. This is an age of frankness, directness and simplicity. If you really want more stockholders among your customers, you must go after them candidly and openly. Don't tell them the benefit will be theirs only—but that the advantages will be mutual. Not long ago one of the power companies in this State received authority to add a temporary surcharge to its rates. A certain consumer living in the territory supplied went to his neighbor one day and said, "How about this surcharge the power company is collecting? Don't you think we had better look into it?" The neighbor replied, "No, I have been making inquiries regarding the uncontrollable expenses our company has had to face, and we feel that the surcharge is justified." The other man exclaimed, "What do you mean by 'our company'?" The reply was, "Oh, I'm a stockholder of the Power Company."

What better plan for its own protection and prosperity can a public utility company adopt than by making the Man in the Street a full partner in the organization? If the company is properly managed, if it has made a favorable impression upon the Man in the Street, he is already predisposed in its favor, and it will not be difficult to convince him that in order to make the relationship perfect, he should be a stockholder. His desire to become a stockholder will probably be in direct relation to the treatment he may have received from your company in the past, and if he has been well treated the amount of stock he will take will probably be limited only by his financial capacity.

The conclusion which I have attempted to lead up to in the presentation of this address is that human beings are not like merchandise, nor are they to be handled like merchandise. Dealing with the Man in the Street is a problem in personality, and it is through the point of contact, wherever it may be: at the counter, over the telephone, through correspondence or when and where service may be rendered, that the favorable impressions are created which ultimately affect the prosperity of the utility company. The physical assets of a corporation may be of fabulous value and may make a handsome showing in an annual report to shareholders, but the value of that intangible asset, the confidence and good will of the Man in the Street, may be, after all, the one great element which produces earning power and gives stability to the property.

Accidents to Men who Handle Power Lines are Out of Proportion—and Largely Preventable

Accidents to employees of electric light and power companies show a very large percentage to the men who handle the lines as compared with other occupations incident to this industry.

Rules, regulations and precautionary notices regarding the handling of live lines are issued by many electric light and power companies and because of these rules and regulations, it is often assumed that dead lines only are handled, and in many cases no provision is made to take care of work on live lines, that is, insulating tools and appliances are not considered necessary and instructions for handling the work on live lines are omitted.

It should be remembered that some lines must be handled alive if continuous service is to be obtained, and caution is necessary whether the lines are dead or alive. Work on dead lines is mostly of an emergency nature. It is often done hurriedly and at night and the lines worked upon are generally in close proximity to live conductors. With proper care and equipment live lines can be handled safely. Why is it not good practice to keep the lines energized and handle them accordingly?

The following paper was read before a recent meeting of the Michigan Section of the National Electric Light Association. It contains some brief instructions to employees of electric light and power companies covering the safe handling of live lines and equipment.

Working Safely on Live, High Tension Lines—Live Lines and Circuits Ordinarily Dangerous

Ordinarily live, high tension conductors are dangerous to touch or approach, and they can only be handled safely by those who have been properly trained and equipped for the work. Energized electric light and power circuits should be handled carefully under all conditions, and in no circum-

stances is greater caution required than in the installation and repair of high tension lines and equipment.

Hazards Not Only Electrical

Some causes of accidents are common to most industries, and the danger to the electrical worker is not only due to shocks and burns, but also to falls from towers, poles or other elevated structures. Many conductors are placed underground, in conduits and in tunnels, and there is sometimes danger from explosive or inflammable gases. The question of asphyxiation of employees must also be taken into consideration. Coal or coke dust, or any deposit on the insulators in the nature of conductor, or partial conductor of electricity, increases the chances of flash-overs and danger to the worker. The weather affects operating conditions—rain, snow, wind, sleet, and lightning generally mean work for the trouble man, and quite often the most dangerous work to be done is during or immediately after a storm.

It is sometimes good practise to consider "dead" lines as energized and handle them accordingly. Lines supposed to be dead may be energized by the accidental closing of a switch; a live conductor may swing into and energize the supposedly dead lines; a dangerous potential may be induced from lines in the vicinity. Men working on long transmission lines have been injured when lightning has struck the line at a distant point. Lines should not be treated as "dead" or not energized unless they are short circuited and probably grounded.

Educating the Public

The use of electricity is daily becoming more general, and a net work of electric wires extends over and under the streets of our cities and across the fields of our country. The number of injuries due to the public, wittingly or un-

wittingly, coming in contact with live conductors is unnecessarily high. Experience teaches us that most accidental injuries can be prevented by education. Persistent instruction to the public would tend to decrease some of these accidents.

Scope of the Paper

In this paper an attempt will be made to outline some of the precautions to be observed for the safe handling of live or energized lines and equipment. It will deal more particularly with electrical hazards rather than those common to most industries.

Selection of Men for Line Work

Records show that linesmen and patrolmen, that is, the men who handle distribution circuits and transmission lines, sustain a large percentage of the fatal accidents to employees of the electric light and power companies and particular attention should be given to the selection of men for this work. In dealing with the problem of safety to linemen, it should be realized that most of the accidents are due to mistakes, lack of instruction or the incompetence of employees. Such accidents can be prevented by education. Very few of the accidents are due to mechanical or physical conditions of the property.

Construction of Lines

If the construction of the lines to be worked upon is of a temporary nature, the clearance and other physical conditions should be checked up. If it is essential that such lines be worked on while energized, it may be necessary to build special platforms and barriers before any work can be done.

Distribution Circuits and Transmission Lines

Electricity is sometimes generated and distributed at from 2,300 to 7,500 volts. In other cases it is generated at from 2,300 volts to 7,500 volts and it is then stepped up by means of transformers to from 30,000 to 150,000 volts and transmitted long distances and then stepped down again and distributed at lower voltage. On account of the greater difference in voltage between distribution lines or circuits, and transmission lines, two distinct safety problems are presented. Methods and practices that would be safe when considered in connection with distribution circuits, would be out of the question for the higher voltage transmission lines.

Special Insulating Rods Needed for Work on Transmission Lines

Live distribution circuits can be worked upon safely in good weather when the poles are dry without any intervention between the worker and the live conductors, except a good pair of rubber gloves or other comparatively thin insulating guard. It should be remembered that the dry pole renders protection as well as the rubber gloves. When work on high tension transmission lines is to be done, long insulating rods, tongs or similar appliances that isolate as well as insulate must be used.

Trained Men Essential

A competent crew of trained men is essential if work on live lines is to be performed safely. Too much care can not be taken in the selection and training of the foreman who has to take immediate charge of the work and all of the men must be instructed as to the character of all lines and equipment on or near which they are to work. Employees should not be left to learn their work by the "absorption" method, they should learn by the "intentional" method, that is, it should be the duty of some competent person to instruct them. Some foremen consider their duties fulfilled when they have briefly outlined to the men under them the work to be performed, but in order to insure safety they, or some authorized instructor, must give repeated and detailed instructions. Sometimes men do not fully understand or they for-

get their instructions. The foreman should satisfy himself that all of his men are competent and their knowledge of line conditions and hazards should not be taken for granted.

Insulating Tools and Appliances

In addition to being properly qualified to perform their work employees must be equipped with suitable insulating appliances for the safe testing and handling of live equipment and lines. All insulating tools and appliances must be inspected and tested regularly and they must be properly stored or taken care of when not in use.

Rubber Gloves

Rubber gloves, when not in service, should be stored in a dry and cool place where the temperature does not exceed 75 deg. F. The gloves should not be exposed to the light and each pair should be kept in a separate box. If rubber gloves have to be stored for any length of time, it is a good practice to take them out periodically and roll or crumple in the hands. They should then be straightened out and laid away again. This practice seems to revive the rubber and lengthens the useful life of the gloves. It should be borne in mind that a perfect pair of gloves can be rendered useless for work on live conductors if subjected to rough usage. They should not be worn while climbing as a splinter or a slight abrasion or puncture will destroy or lessen their insulating value and render their use a hazard instead of a protection. Special care should be exercised to avoid puncturing the gloves when making a wire splice. It is advisable to wear leather gloves over the rubber gloves to protect them.

Shields or Protectors

Linesmen's shields or protectors should always be used when work is to be done in tight places on distribution circuits. These shields which are of rubber, or some other insulating composition, are for placing over live conductors that are in close proximity to the lines on which the work is to be done. These protectors are guaranteed by the manufacturers to withstand all ordinary distribution circuit voltages. They are of great help to linesmen and their use should be encouraged. When not in use, shields should be placed in substantial boxes. They should be carried to and from the place where the work is to be done in these boxes. If this is not done, they are liable to be damaged by contact with the other tools in the line-wagon.

Linesmen's Spurs

Linesmen's spurs are necessary for climbing wooden poles, and they should always be in first class condition. The gaffs should be kept sharp and should be replaced when they are so short that they will not puncture into the wood far enough to hold safely. The straps and buckles should be inspected frequently for defects. Spurs should only be worn when they are actually needed for climbing. They should not be worn while travelling to or from work. Fooling and scuffling among linemen while wearing their spurs has been the cause of many accidents.

Safety Belts

Safety belts are essential for preventing accidents to linesmen, and yet quite frequently they are not used. The materials used in the manufacture of these belts should be the best obtainable and the workmanship should be of the best. They should be inspected frequently to make sure the straps, rings, snaps, rivets and buckles are in good condition. When using a belt, care should be taken to see that the straps and buckles, are properly secured before weight is brought to bear on them.

Rubber Boots and Coats

Special rubber boots and coats are now used quite extensively by linemen, their use being especially valuable when

work is to be done during or immediately after a storm where broken lines or falling wires have to be handled.

Ropes and Insulating Rods

The ropes used in connection with the work on high tension transmission lines should be impregnated with paraffin and kept in a canvas bag. The insulating rods should be thoroughly treated with paraffin. A drying room or oven should be provided where the tools can be thoroughly dried and then treated. This should be done at regular intervals.

All Insulating Tools and Appliances Should be of an Approved Standard and Inspected Regularly

Insulating tools and appliances should be of the best obtainable and employees should be instructed that they must not use anything else as a substitute. The insulation commonly placed around the handles of pliers, screw drivers and other tools used by linesmen serves to keep static away but should not be relied upon for complete protection. Rubber gloves, in fact, all insulators may lose their insulating qualities and become incapable of resisting high voltage by wear or by deterioration. If they are not inspected and tested periodically, their use may prove a hazard instead of a protection.

Instructing Employees

First: Employees should be instructed how to avoid shocks and short circuits when working on or near live conductors. Before starting any work they should be informed by the foreman which conductors they are to handle and which to avoid. The employees should be acquainted with the fact that if they are thoroughly insulated from the ground and all other conductors, it is comparatively safe to touch a single conductor, but that contact with two conductors or one conductor and the ground is dangerous and may result in injury. The foreman should caution his men to keep all parts of their body, as well as feet and head, away from live conductors. Rubber gloves and the insulation on high tension wares cannot be relied upon as a complete protection against shock and this also should be explained to employees.

Second: Linemen, before climbing, should be satisfied that the pole or tower is in good condition and strong enough to bear additional weight. Poles may be tested near the ground line for decay with a bar or screw driver, and sounded for decay at the centre of the pole by rapping with a heavy tool or block of wood. When poles or crossarms are apparently unsafe, they should be properly braced or guyed before any dependence is placed upon them for personal safety. No employee should go among any wires until he knows their condition and voltage, and knows that it is safe to do so. Leaning over and crowding through unprotected wires should be avoided.

Third: Sometimes because of leaking insulators, defective transformers or broken ground wires caused by storms, or other unusual conditions, poles or towers may be energized or "hot" and difficult or even dangerous to climb. If it is necessary to do work upon a line or circuit and conditions are such that pole cannot be mounted or climbed without danger, the circuit should be made "dead" at least until protective shields, barriers or other safeguards are in place. Employees should be instructed not to work immediately above unprotected live lines or equipment, as a tool, rope or a branch of a tree dropped across a high tension line might result in a flash with serious consequences. The rule "work from below" is a good one and should be enforced whenever practicable.

Fourth: Underground electrical workers are exposed to special dangers. There is always the possibility of gas in tunnels, conduits and manholes, and employees should be cautioned not to smoke and to keep all open or exposed flames from manholes. They should report to their superior

officers unusual evidences of gas and should not enter a man-hole opening if the slightest danger is evident. The use of a plumber's torch should be avoided as far as possible.

Fifth: Numerous accidents have occurred to linemen when working on new extensions to distribution feeders, due to the fact that the extension has been connected or tapped on to the energized circuit before the new work was completed. New work should be finished and all of the crew engaged on the work notified before the "hot tap" is made.

Transmission Lines

What has been said in the foregoing applies more particularly to distribution circuits. The following will apply to transmission lines.

Transmission Lines Now Handled Alive

A few years ago working on live, high tension transmission lines was considered foolhardy and out of the question except in rare cases and under extremely dry climatic conditions. Today, insulating rods, tongs and similar appliances have been so developed that 140,000 volt transmission lines can be handled alive with no greater hazard than accompanies the handling of 2,300 volts distribution circuits with the protection afforded by rubber gloves.

Replacing Defective Insulator

By means of the improved appliance, the insulators on live, high tension lines can be tested while in position and the defective insulators weeded out and replaced with good ones.

Long Insulating Rods Used

Several different methods are used to test and change the insulators, the fundamental principle of them being that there is always a long insulating rod or other appliance between the man and the live part that is to be worked upon. Various patented devices in the shape of tools are used on the ends of insulating rods for removing and replacing tie wires on pin type insulators and for removing and replacing cotter pins on suspension type insulators. Special long handled testing poles for picking out defective insulators are also on the market. In testing insulators on live lines advantage is taken of the fact that a difference of potential exists between the cap and pin of a disc insulator. A wire fork on the end of an insulating pole is used in some cases for making the test, placing the wire across the insulator between the cap and pin. If the insulator is good a static spark is obtained and the absence of spark or a weak spark shows that the insulator is defective.

The following is a brief description of one of the methods used to change defective insulators in high tension lines. The insulators are first tested and the defective ones noted, a record being kept of the pole, or tower and the position of the insulators. A crew generally consisting of six men and the foreman do the work of changing the insulators. First, long insulating rods are attached to the wire and the line secured in position and held so that it cannot swing into the poles or towers. By means of rope blocks the rods are made to force the wire upward and away from its regular position. The insulator is then disconnected from the wire after which the insulator can be removed and replaced or any necessary changes made. With proper tools it is not necessary for any of the workers to approach or place their hands or any part of their body within dangerous proximity of any live conductor.

Special Precautions to be Observed in Case of Line Trouble

Noise and static on telephone lines, discharging lightning arresters or an unusual amount of static on or around lines and insulators indicates trouble and it may be due to defective insulators or to an "arcing" ground, on the high tension lines. Foremen should instruct their men to work with ex-

treme caution at such times. It is generally advisable to stop the regular work of changing insulators until the cause of the trouble has been located. This precaution should always be heeded on systems with a grounded neutral.

Before any work on high tension transmission lines is undertaken, for the first time, a careful analysis should be made of the job. Each operation should be considered and men should be selected and trained for the different operations they have to perform.

It is interesting to note that linemen who have tried both methods of changing insulators would rather work on live lines with insulating rods between them and the line, than on "dead" lines without this protection. The dangers incident to the accidental energizing of lines that are supposed to be "dead" are eliminated. Emergency or rush work which always adds to the hazard is to an extent avoided and the work can generally be done in the day time when the light is good.

Telephone, telegraph, signal and other lines that parallel high tension lines are always liable to be more or less energized and dangerous to handle. This fact should not be overlooked in instructions given to linemen.

To Sum Up

The prime requisites for safe working on high tension lines are: Safe construction, a good foreman, competent workmen equipped with proper tools and insulating appliances.

Large Shawinigan Contract

Official announcement is made of the closing of a contract for the supply of power by the Shawinigan Water & Power Co. to the new sulphite pulp plant being constructed at Three Rivers, P. Q., by the International Paper Co. This is situated on 70 acres of land now partly occupied by the St. Maurice Lumber Company, a subsidiary of the International Co. The initial supply of power will be 20,000 h.p., to be increased as required. The International Co. at one time had under consideration the development of the Les Forges and La Gabelle Rapids, which are low head propositions, but it is understood that these will be taken over by the Shawinigan Co. under the terms of the agreement with the International Co. The entrance of the latter concern into the Canadian field of pulp and paper manufacturing is another instance of the legislative action which has compelled American paper companies to cross the border. The International Co. have very extensive timber limits in Quebec, and under Quebec laws cannot import its pulpwood from Crown lands into the United States. The St. Maurice Lumber Co., the subsidiary which manufactures lumber at Three Rivers for the Canadian, United Kingdom and U. S. markets, and also pulpwood, owns six mills in the province of Quebec, five of these being roasting mills. The cut is chiefly spruce.

The project for a sulphite mill involves a boiler house, 90 x 65 ft., equipped with B. & W. boilers, to be heated with coal or oil. The main building, the sulphite mill, will be 560 x 85 ft. There will also be a chipper room, 100 x 50 ft., and two shops. Foundations are to be of reinforced concrete, while the buildings will be of steel with brick walls and metal roofs. The paper mill will be built later.

Further Judgement in Theft Case

Mr. Justice Coderre handed down judgment in the Practice Division of the Superior Court yesterday afternoon ordering the issue of a writ of certiorari in a case in which the legal question at issue is whether the Provincial Government has exceeded its powers in granting to the Montreal

Light, Heat & Power Company authority under its charter to prosecute clients for stealing electric power.

Max Rosenbloom, merchant, was convicted by Judge Leet and fined \$100 on a charge of having stolen electric power from the Montreal Light, Heat & Power Company at his store on St. Catherine street. The company prosecuted Rosenbloom in virtue of the powers accorded to it by Section 26 of its charter, which was granted by the provincial Legislature. The amount of the fine imposed under this section is payable to the company.

Counsel, in opposition to the conviction, petitioned for a writ of certiorari, to be directed against the Montreal Light, Heat & Power Company, and the magistrate. It was urged that the charge against the petitioner was virtually that of theft, and theft, being a criminal offence, fell under the exclusive jurisdiction of the Federal Government; that the Provincial Government could not legislate on criminal law; and while it had the right to give the respondent company its charter, it had no authority to put therein a section giving the company the power to prosecute people in cases of theft.

The writ was made returnable within the statutory delay of six days, when it will be argued on its merits.

C. G. E. Co. Joins "Society"

The Canadian General Electric Company, with headquarters in Toronto, has become a member of The Society for Electrical Development, as have several Toronto contractors and dealers. It is planned to extend the work of the Society throughout the Dominion on an increased scale. The Hon. Frederic Nicholls, who for over thirty years has been prominent in Canadian electrical industrial activities, is president and general manager of the Canadian General Electric Company. Mr. A. S. Edgar, supply sales manager, together with Mr. Horton and Mr. Mallett, from the main office, have recently been spending considerable time in the offices of the Society planning the co-operative work.

The company is at present building a further structure to house what it is claimed will be the finest and most complete electrical show rooms in the Dominion. Many unique features will be incorporated in this department, which will be operated largely for the convenience of the contractors and dealers of Toronto and the surrounding cities. There will be rest rooms, consultation rooms, with stenographers in attendance, rooms for demonstrations of electrical appliances and specialties and provision made for carrying on educational work within the trade.

Montreal Electric Luncheon

At the opening meeting of the Montreal Electrical Luncheon, held on October 1, plans for the coming season were discussed. Mr. W. H. Winter, who presided, referred to the annual increase in the average attendance—in 1916-17 it was 48, in 1917-18, 58, and 1918-19, 65. He was convinced that the luncheon had brought electrical men closer together, and had resulted in mutual advantage. He invited the co-operation of all those interested in the industry. It was decided to elect the following as a nominating committee for the election of committees: Messrs. P. T. Davies (chairman), S. Svenningson, E. S. M. McNab, W. P. Roper, R. Moncel, and J. J. Dougherty.

Thornbury Plant Destroyed

The Thornbury electric light plant was destroyed by fire on October 12. This plant was installed in 1913 and consisted of a 60 kw. generator, belt driven from a 75 h.p. water turbine. The plant is municipally owned.

A 32,500 kv.a. Waterwheel Generator

By R. B. Williamson*

The Electrical World prints a description of the 32,500-kv.a. generating unit for the Niagara Falls Power Company that has been under construction during the past year by the Allis-Chalmers Manufacturing Company. This unit is mounted directly above a 37,500-h.p. turbine, the two forming a close-coupled unit with but a relatively short distance between the two machines. Thus the shaft can be made short and stiff and the combined unit has but two guide bearings, one at the top of the generator immediately below the thrust bearing and the other directly above the waterwheel runner. To carry the generator a large cast-iron barrel of heavy-ribbed design is bolted to the cast-steel speed ring of the turbine, thereby transmitting the weight of the generator through the barrel to the speed ring and foundation below the wheel. This shell forms a pit liner and at the same time connects the wheel and generator rigidly together, thus insuring accurate alignment. The connecting barrel also forms a support for the operating cylinders that control the gate opening of the wheel.

With these large vertical units it is necessary to provide brakes for bringing the machine to rest and for holding it in case of leakage through the wheel. In this instance the brakes are operated by air pressure and engage the lower surface of the field spider rim. Since the support for these brakes has to be able to take the whole weight of the rotating element in case it is necessary to relieve the thrust bearing of the weight, the brake support has been designed in the form of a conical cast-iron shell made in sections and supported by the barrel connecting the wheel with the generator. This forms a strong, compact arrangement, and the brake support incidentally forms an air inclosure under the generator to prevent the air discharged by the fans from passing into the wheel pit.

The generator is wound for 12,000 volts, three-phase, and will be operated with neutral grounded through a resistor. The frequency is twenty-five cycles at 150 r.p.m., the machine having twenty poles. While this generator is of very large output, the design in general does not differ greatly from that found in other large waterwheel machines. Since the speed of 150 r.p.m. is not so high as to introduce any unusual problems, the design of the rotor is less difficult than in many machines of much smaller output running at higher speed.

Based on the runaway speed of the waterwheel (approximately 85 per cent. overspeed), the stresses in the rotor will not in any case exceed one-third the elastic limit of the material. The rotor spider is made up of two wheels each of which consists of an inner cast-steel spider on which is shrunk a cast-steel field ring. Dovetail slots in the latter afford means for attaching the field poles, two dovetails being provided per pole. By this construction the field ring can be cast without local shrinkage stresses due to spokes, etc., because it is in the form of a plain ring made with uniform section.

Two rings were cast with exceptionally large risers, and very universal castings were thus secured. Other advantages in making the rings separate are that they can be machined inside, thus insuring better balance; moreover, any stretch due to centrifugal force does not cause local stresses in the inner spider arms. Each pole weighs approximately 3 tons, but the face of the rotor is so wide that the dovetail stresses are not more difficult to keep within safe

limits than on many smaller machines. The total weight of the rotor with its shaft is approximately 265,000 lb., and the fly-wheel effect of the rotor is 10,500,000 lb.-ft. sq. Including all parts the machine weighs slightly under 300 tons.

For the stator yoke the usual box-frame design made in sections was employed to facilitate transportation and foundry work. The stator core will be stacked and the machine wound in the station. All parts have to be lowered over the cliff at Niagara Falls in order to place them in the power house, and this condition had to be kept in mind in designing the machine. When installed the stator yoke will be surrounded by a sheet-steel casing, which will conduct the hot-air discharged through the yoke openings to suitable ducts.

Dovetail projections hold the stator punchings in the yoke, the iron sections varying from $1\frac{3}{4}$ in. to 2 in. in thickness. Ventilating ducts are provided in the usual manner.

Combined waterwheel and generator—Rated at 32,500 kv.a.—
For Niagara Falls Power Company

The inside diameter of the stator punchings was fixed largely by consideration of the shipments of the rotor parts and the use of a solid rim for the rotor-field ring. In this case the diameter is 16 ft. 4 in., and the peripheral speed is 7700 ft. per minute. The outside diameter of the stator yoke is 21 ft.

Two-layer winding with fifteen slots per pole, or 300 coils in all, is used for the stator. The winding is arranged for Y connection, each end of each phase being brought out of the machine to permit the insertion of current relays and grounding the neutral through a resistance. Although the temperature guarantees are those corresponding to class

*Engineer in Charge of Alternating-Current Design, Allis-Chalmers Manufacturing Company.

A insulation (A. I. E. E.), the coils are provided with mica insulation (Class B) both for the individual turns and also for the outer slot insulation, thus giving a large margin of safety.

Protecting Coils Against Short Circuits

While this unit has a very large output, the problem of supporting the ends of the stator coils against damage from short circuits is not so difficult as in many machines of smaller output operating at high speed, as, for example, turbo-generators. The reactance of a relatively low-speed machine of this kind is high, in the present case about 20 per cent., and this limits the momentary short-circuit current to safe value. Again with a twenty-pole machine the coils do not project such a great distance beyond the stator core as in higher-speed machines. In the present design the coils are securely blocked just where they project beyond the core to protect them against any side motion and consequent danger of breaking the insulation at the ends of the slot. They are also lashed to the insulated supports as indicated in the accompanying sketch. These supports are made in sections and are bolted to projecting brackets cast on the stator end heads. The design is such that all metal parts near the coils are heavily insulated, and the supports themselves are arranged so that they cannot form conducting paths for stray currents induced by leakage fields from the winding. The diagonal parts of the coil ends are separated by blocking corded in place, and, in general, the method of coil support follows the practice that has been found successful in turbo-generators.

In designing the three generators for this development different manufacturers co-operated with a view to having the external appearance and general dimensions correspond as nearly as practicable, so that the finished installation would present a uniform appearance. The upper bridge that carries the thrust bearing has eight radial arms and is of cast steel made in two parts. Directly below the thrust bearing is the upper guide bearing, which is 22 in. in diameter and 36 in. in length. A Kingsbury thrust bearing, 49 in. in outside diameter and capable of carrying a suspended load of 465,000 lb., is provided. This has been ample to carry the weight of the rotor, waterwheel parts and downward hydraulic thrust on the turbine runner. Notwithstanding the heavy load supported by this bearing, the estimated friction loss is only 26 h.p. at 150 r.p.m. The bearing runs in an oil bath through which oil, supplied from a central system, is circulated at the rate of 35 gal. per minute. Where the shaft passes through the thrust bearing it is 18 in. in diameter; at the centre of the rotor spider the diameter is 26 in., The shaft projects a short distance below the bottom of the machine and is provided with a 45-in. diameter forged-on flange for bolting to a corresponding flange in the water-wheel shaft.

Arrangements for Oil

Special care has been taken in the design of the oiling arrangements in order to make these as simple and reliable as possible. Oil supplied to the machine from the central system first passes through a duplex strainer; it then flows through separate branches of the feed pipe to the thrust and guide bearings, each pipe being provided with a regulating valve and sight-flow indicator. An oil meter is placed in the thrust-bearing supply pipe, and thermometers are provided for both thrust and guide bearings. Seamless steel tubing expanded into flange joints is used for the drain pipe. An oil-feed pipe is of copper with brazed flange joints.

As this generator requires approximately 80,000 cu. ft. of air per minute for carrying off the heat, the arrangements for handling the air required careful consideration. Air is taken in at the top and also from the pit underneath, and, after passing over the windings and through the stator

core, is discharged into the casing surrounding the stator yoke. It then flows through ducts and is forced out of the station by means of auxiliary fans. The rotor is provided with steel-plate centrifugal fans on both top and bottom to force the air through the machine. A strong blowing action is also exerted by the poles and the ventilating openings between the poles in the rotor rim.

Ontario Safety League Activities

Last May the Ontario Safety League announced a series of cash prizes for a composition by school children in Ontario on the subject "How Children May Help to Avoid Accidents." The prizes were donated by the Ontario Motor League to assist in the campaign against preventable accidents. Scholars were divided into two classes, 12 years and under, and 13 years and over, six prizes being given in each case, the first of fifteen, two of ten and three of five dollars each. The four best letters are given below as indicating the amount of interest that is being aroused in children on the importance of observing the admonition to "stop, look, listen."

First Prize—Class A

Children should form a habit of carefulness. Bad habits and carelessness are the cause of most accidents. The most important habits are obedience and listening to what adults tell us.

Because we see older people going close to moving automobiles we should not do it, because they do not get excited so readily.

We should train the little ones both by example and precept. In the evening take them to the park and keep them off the street.

When crossing the street watch the moving cars and the drivers' signals. We must always cross at corners. Cars should always run on the right-hand side of the street. This helps us to avoid motor accidents.

One day I saw a big boy sitting on the back of an automobile. This may have led to the death of a small boy who tried to do the same.

JAMES BRADLEY (age 10),
Cambridge Street School, Ottawa.

Second Prize—Class A.

Stop, before you cross the street,
To and from the school,
On your way remember this,
Precious, golden rule.

Look up, then down,
On left and right,
One careless run
Kills many outright.

Listen for the motor,
In the night or morning,
Stop, and listen for its horn,
Take heed unto its warning,
Even when you're in a hurry,
Never cross streets in a flurry.

HELEN HAGERTY (age 12),
St. Patrick's School, Toronto.

First Prize—Class "B."

Bobby's mother was tenderly putting him to bed, for he had just escaped being run over by a big green roadster on the highway in front of his home.

"Oh, mother," he sobbed, "how may I keep from being run over by those awful big fast cars?"

"There are many ways," replied his mother soothingly.

"You must be alert and keep looking in all directions when you are on any public highway. When you wish to cross the street or road, do so without loitering. When you play, invite all your little friends into the yard at the back of our house, where no automobiles intrude. Then, to save other little children from danger, you should not chatter to your father when he is driving our car, because you take his attention away from the road and his steering."

The mother stooped and, kissing Bobby good-night, added: "I hope you will remember this little talk and give all your little friends this same warning."

ANNA B. RUSSELL (age 18),
Woodstock College, Woodstock.

Second Prize—Class "B."

How often we read of serious motor accidents! They are happening every day in our lives, and every one ought to do all in his power to avert such mishaps at the present time, when the chances of accident are so many and varied. Accidents may often be avoided by keeping the phrase "Safety First" always in mind.

Children especially, in the thoughtlessness of play, dash across the street without stopping to think of the silent automobiles gliding along. To prevent probable accidents here, I should say to all children, "Do not play games on the public streets at all." There is always some nice park near, where games can be played. Then, again, before starting to cross a street, every child should glance to right and left to make sure there are no autos near enough to harm him. Children should remember not to step out suddenly from behind a car or other vehicle, and they ought never to cross a street diagonally, especially at intersections.

MARGARET THOMSON (age 14),
Earl Kitchener School, Hamilton.

Turning Complaints Into An Asset*

"Who, where and what represents your point of contact with the public? Is that point of contact sharp pointed—hard; or is it well oiled and greased and non-friction producing? The public, whose servant you are, forms its opinion as to the kind of servant you are from its point of contact with the company, with the employees of the company who it comes in contact with, and the public will let its complaints be known to and through such employees. Many small and trivial complaints, made by the public, are received with equally small and trivial attention, and the public goes on from day to day feeling that its complaints are not received with that degree of seriousness that attaches to the mind of the party making the complaint.

"Complaints, when made and received, should be received pleasantly, considerately and thankfully. The party to whom complaints are addressed should be courteous, conciliatory and helpful. Your average customer does not know the president of the company, the vice-president, the board of directors or other executive officials of the company, nor does he care who they are, but he does know the troubleman, your lineman, your cashier, your bookkeeper, your complaint man and such other of your employees as he comes in contact with; and it is by the conduct of these people that he does know the company, and it is by his contact with these people that the reputation of the company in the community is established—that is, good or bad.

"Is your reputation in the community you serve good

or bad? If it is not satisfactory to the public, not to you, then educate your points of contact with the public to the performance of their full duty to the public.

"The public is generally concerned only as to the character of service that you render, and embraced within the character of service rendered is, of course, the manner in which the public is handled and treated by your employees." Mr. Webster then went on to state that not more than 10 per cent. of the people who felt they had complaints to make made them, according to his experience with the U. S. Railroad Administration. It is important therefore that what complaints are made should be handled tactfully, that those making the complaints be shown courtesy and that their complaints be met and considered. He then went on to say that public relations could frequently be improved by more careful handling of complaints, thus bringing about a more satisfactory financial result to the company furnishing the service. A number of examples of different ways of handling complaints were presented, with their conclusions and morals.

"Which foot do you start out on in the handling of complaints? Is the company always right from the beginning, or is the customer sometimes right?" asks Mr. Webster.

"Satisfactory and friendly handling of complaints is one of the biggest assets a public servant has. The goodwill, aye, the good word spoken, as to the company's fairness in handling complaints means ever so much to the company; it increases the morale of its employees; it encourages growth in the community; it means sympathetic consideration in supplying increased revenue to meet increased costs of operation—all of which are vitally necessary in the successful operation of a public utility.

"Don't compromise just complaints and feel that you have served the company's interest; let the complainant himself suggest the solution and then gladly and freely and in a friendly way accept his decision; it means a friend in the community, a booster for the company's fairness; and additional money in the till at the end of the year.

"In conclusion: Make another study of your points of contact with the public; see if you have a friendly and smiley man or woman properly inoculated with the public point of view, handling your complaints; if you have not, make transfers until you do get one, and do it promptly.

"Receive complaints with a smile and with sympathetic consideration. Thank people for affording you an opportunity of making specific and special investigation as to matters affecting the operation of your organization. Assure them that their complaints will be handled promptly—then see that such handling is made.

"Don't compromise just complaints—go the whole route, and lastly lay all your cards on the table—face up—in explaining the result of your investigation; accept censure when due and promise to remedy the situation—then do so."

Death of Frank J. Lyman

Mr. Frank J. Lyman, managing director of the Lyman Tube & Supply Co., Ltd., Montreal, died suddenly on October 2, aged 42. He was the founder of the business, which was the successor to the railway department of John Miller & Son, Ltd., Montreal, of which department he was ten years manager prior to the establishment of the Lyman Tube & Supply Co., distributors in Canada for the National Tube Co., Canadian agents for the Electric Service Supplies Co., Philadelphia, and also for several high class electrical and mechanical specialties. Mr. Lyman's most notable characteristic was his loyalty to personal and business friends, of whom he had a large circle. His death involves the loss of a man of unusual business abilities.

*Mr. J. P. Webster, before N.E.L.A.

The Synchronized Induction Motor

By Mr. F. Keith D'Alton

To the electrical engineer, the characteristics of the squirrel cage polyphase induction motor are very well known. It is the purpose of this article to illustrate the effects of so modifying the rotor of such an induction motor that the machine will automatically synchronize itself and will show considerable stability in operating as a synchronous motor.

The information in the following paragraphs was obtained from a series of tests on a standard one horsepower, four pole squirrel cage motor designed for operation on a 60 cycle, 220 volt, 3 phase supply.

In order that it would be possible to compare the characteristics of the machine after altering the shape of the rotor, with those of the same machine as a standard induction motor, a complete test was run before any changes were made in the mechanical construction. From these tests information was obtained which appears as dotted lines on the accompanying curves.

The forming of this machine into a synchronous motor required that four wide grooves (for four pole machine) be cut in the rotor so as to form in this rotating element four salient poles. There is room here for considerable difference of opinion as to the width and depth of these grooves which will give the greatest satisfaction, in other words, the highest pull-out torque.

The field form, i.e. the wave form of the flux in the rotating magnetic field, before alterations, was assumed to be a sine wave. With this assumption, it seemed best to make the width of the groove equal to 30 electrical degrees—or one-third of the pole pitch—and to cut it to such a depth that we would cut each rotor bar to its centre line in the section removed. In this way, the total pole surface would be two-thirds of the original cylindrical surface of the rotor.

A change of this nature will, of necessity, increase the maximum flux density in the iron, when operating (at normal voltage and frequency) as a synchronous motor, above the density when operating as an induction motor. It was estimated that this increase would be in the neighborhood of thirteen per cent. and this figure is confirmed by a comparison of the exciting currents under different conditions of operation.

Fig. 1—Efficiency characteristics at 60 cycles with various loads; induction motor (dotted line) and synchronous motor

son of the exciting currents under different conditions of operation. Due to this increased density which is accompanied by a reduction in core loss, the power factor as a synchronous motor is lower than as an induction motor.

The following were the measurements made when running light:

	Synchronous	Induction
Volts	220	220
Amps.	2.4	2.13
Watts	120	155
P. f.	13%	19%
Freq.	60	60

The comparative characteristics of the motor under load are very interesting—In Fig. 1 are shown: Efficiency curves, both synchronous, and induction for 60 cycles operation. At an output of 0.512 horse power the motor pulls out of synchronism and runs as an induction motor with wider average air gap than before the mechanical changes were made.

As a synchronous motor the efficiency follows a curve of the shape that would be expected but higher than the efficiency as an induction motor. The increased efficiency on these low loads is probably due to the elimination of any slip and reduction of rotor iron loss up to the point of pulling out. After dropping out of synchronism, the efficiency is much lower, by apparently an almost constant percentage, than that obtained as an induction motor. The extent of

Fig. 2—Power factor at various loads, 60 cycles; induction motor (dotted line) and synchronous

the instantaneous drop in efficiency at the point of pulling out is clearly seen from the curve.

Considering next, Fig. 2, it will be seen that the power factor as a synchronous motor is less than the original power-factor as an induction motor, not only when the motor is without load but with all loads which the machine is capable of carrying.

There is a distinct drop in power when the motor "pulls-out". This may be due to the fact that when running below synchronism the air gap is continually varying in width, thus increasing its reluctance at certain positions, and in effect the average reluctance is increased.

In the matter of slip (Fig. 3), it is at once realized that this factor must be zero up to the point of pulling out of synchronism. At this point, the slip appears and immediately reaches a value a little greater than when operating as an induction motor. The slip, however, does not increase with load as rapidly as may be expected, nor in fact, does it increase as rapidly as with the motor unchanged mechanically, with the result that the slip is about the same at full load, whether the motor be induction as originally, or synchronous with mechanical changes as previously specified.

In slipping, with the salient pole rotor, there is an ir-

regular angular velocity. The rotor endeavors to pull back into synchronism each time the rotor pole passes an area of greater density in the stator flux. Failing to pull back, it slips quickly to the next pole. This results in periodic pulsations in speed which are most noticeable with small slip but practically disappear when the slip increases to about six per cent.

Since there is an increase in flux density in the syn-

Fig. 3—Slip at 60 cycles, various loads

chronous motor over that existing in the same machine as an induction motor, it is not surprising to find that the line amperes drawn under these different conditions when running light are roughly in proportion to the flux densities. (Fig. 4).

There is a rapid rise in current just before the motor pulls out. Possibly there is a crowding of flux to one side of the salient poles, resulting in increased density and consequently a rapidly increasing magnetizing component in the current. As the motor pulls out of synchronism the current immediately increases about fifty per cent. Since this is accompanied by a drop in powerfactor, it indicates a further large increase in the magnetizing component of current without much increase in the power component.

The pull-out torque of the synchronized motor is 1.5

Fig. 4—Line current, 60 cycles; induction motor (dotted) and synchronous

ft. pds. The "pull in" torque is about one quarter of the pull out torque. With the machine as an induction motor a slip of 1.5 per cent. was required to give this torque (Fig. 5). Obviously then, with the salient pole rotor we have the advantage of synchronous speed with any required torque up to that at which the motor drops its speed, below that of synchronism.

Immediately the motor pulls out it drops two per cent. in speed but it would seem that the wider average air gap

does not affect the slip as much as might be expected for the motor on the higher points of torque has less slip than when it was in the form of a standard induction motor.

In considering the advantages of this modification in the rotor probably the most important are as follows:

- (a) Synchronous speed up to half of full load output.
- (b) Increased efficiency up to half of full load output.
- (c) Less slip on higher loads even though out of synchronism.

As a 25 Cycle Motor

The above motor, as already stated, was a 220 volt 60 cycle induction motor. Some further interesting results

Fig. 5—Torque slip characteristics at 60 cycles

are obtained when this motor is run on 25 cycle current at 110 volts giving 750 r.p.m. as synchronous speed.

At half voltage on 25 cycles the flux density would be 120 per cent of the value it has at 60 cycles and normal voltage. Synchronous speed will be 41.66 per cent. of the 60 cycle synchronous speed, and since the horse power varies as (speed $\times$ torque)—i.e. as speed $\times$ (flux density)²—we would expect that the maximum horsepower obtainable before pulling out would be $0.4166 \times 1.2^2 = 0.60$ of the horsepower obtainable at synchronous speed with 60 cycles, i.e.

Efficiency

Fig. 6—Efficiency characteristics at 25 cycles, various loads; dotted curve is efficiency as induction motor

60% of $0.512 = 0.308$ h.p. In actual test this figure is found to be correct. The tests check very closely in proving that pull-out torque does vary as the square of the maximum flux density.

In Fig. 6 we have the comparative efficiencies at 25

cycles both as a synchronous and as an induction motor. Unlike the sixty cycle results (Fig. 1) the efficiency as a synchronous motor is lower than as an induction motor. There is again, however, the distinct drop in efficiency as the motor pulls out of synchronism.

The power factor as a synchronous motor, Fig. 7, being somewhat similar to the curves obtained in Fig. 2 is

Fig. 7—Power factor at various loads, 25 cycles

lower at all loads (also at no load) than as an induction motor.

In Fig. 8, it is again shown that the motor remains in step until an output of 0.308 horse power is demanded. At this output, as an induction motor the slip would be 3.7 per cent. Upon falling out of step the motor now slips to the extent of 5.3% and as the load increases further the slip increases being always greater with the salient pole rotor than when the machine was a standard induction motor. The effect of the widened average air gap is more noticeable here than in the results at 60 cycles. Fig. 3.

A rather unexpected result is found in Fig. 9 which gives curves showing the amperes per line. Although as with 60 cycles, the amperes at no load as a synchronous motor are greater than as an induction motor, there is a point, approximately at 1.1 horse power output where the amperes are equal for either conditions of the rotor.

Finally in Fig. 10 we find that the pull out torque is

Fig. 8—Slip at 25 cycles, various loads

2.16 ft. pds. or exactly 144 per cent. of pull out torque at 60 cycles. Fig. 5. Since the flux density maximum at 25 cycles is 120 per cent. of the maximum density at 60 cycles we find we have proven what we stated before, i.e. that pull out torque varies as the square of maximum flux density.

In considering again the advantages of the alteration in the rotor if the machine be run at 25 cycles with 20 per

Fig. 9—Line currents at 25 cycles

cent. increase in density, and comparing them with the 60 cycle results we have the following:

- Synchronous speed up to about half of full load output.
- Decreased efficiency at all loads.
- Increased slip on all loads after machine falls out of synchronism.

Obviously, a noticeable change takes place when the flux density is increased from the value it has at 60 cycles (normal voltage) to 120 per cent. of that value. The slower speed alone probably accounts for the decreased efficiency.

At 60 cycles with the same density as was used at 25 cycles, the torque and maximum horse power output would each be increased 44 per cent. This would require an impressed voltage of 264 volts, would require the same cur-

Fig. 10—Torque slip characteristics at 25 cycles

rent as in the 25 cycle test for a given torque and would raise the maximum output available at synchronous speed to approximately three fourths of full load, very materially increasing the efficiency as a synchronous motor but lowering the power factor.

From a further comparison of tests already described, the following general conclusions may be drawn:

- That about half full load is obtainable with synchronous speed at normal voltage.
- That three quarters of full load is obtainable with synchronous speed when the voltage is 20 per cent. above normal.

(Concluded on page 44)

The Contractor-Dealer

The Hardware Man Does Not Take Naturally to Electrical Merchandising—Will the Contractor-Dealer Do It?

At a recent convention of Ontario hardware men, a representative of one of our largest electrical jobbing houses read a paper, portraying in very attractive colors the advantages that would accrue to the hardware merchant who handled electrical devices. Before the National Hardware Association of the United States, at present in convention, the secretary of the American Washing Machine Manufacturers' Association is deploing that "the proportion of production of the washing machine industry distributed through the hardware trade has declined."

On both of these occasions the speakers make direct appeal to the hardware merchant to "butt" into the legitimate field of the electrical dealer.

What is the reason of this?

It can surely be taken for granted that the manufacturer of electrical devices is not naturally disposed to prefer a hardware dealer to an electrical dealer. The inclination would, naturally, be to favor the electrical dealer. The manufacturers' business depends, however, on the amount of his equipment that reaches the homes of consumer and in the last analysis, as a business proposition, he cannot afford to let sentiment play any part. If he can gain his purpose through the hardware merchant more readily and more effectively than through the electrical merchant, he is scarcely to be blamed.

The moral to be drawn from the situation, however, is that the merchandising of electrical appliances is not yet on a satisfactory basis. The fact is that valuable merchandise is for sale and the consumer is waiting with the money in his hand to buy it. The "missing link" is the electrical dealer who will undertake to bridge the gap that is so evident. The hardware man has done this in part because he was established as a retail dealer, but, as shown by the statement quoted above, he is not proving a satisfactory substitute for the electrical dealer.

In making his plea to the hardware association, the secretary of the Washing Machine Manufacturers' Association, Mr. Raymond Marsh, made some very important statements, many of which are applicable in similar ratio to Canada. Being forewarned is being forearmed and we have, therefore, pleasure in reproducing extracts from this paper in the hope that it will enable the electrical contractor to see the situation in its true light. The business is there if the electrical dealer wants it and will take it, but he must not wait too long. In a little while the hardware man and the drug store and the department store and all the others will have accustomed the public to looking for electrical devices among their stock and it will be increasingly difficult to regain his trade. Mr. Marsh's remarks follow in part:

At the very outset I ask you to note that present-day conditions make "electrical household specialties" a necessity—and not a luxury—in every one of the seven million homes wired for electricity. In addition, the remaining fifteen million homes in this country are now demanding

household specialties, not electric, such as hand, water, and gasoline-power washing machines, gas ironing machines for household use, etc.

The "Electrical Household Specialties" industry today includes the following articles:—

Electric Fans	Electric Lanterns
Electric Heaters	Electric Door Bells
Electric Toasters	Electric Grinding Machines
Electric Sad Irons	Electric Light Sockets
Electric Heating Pads	Electric Light Fittings
Electric Curling Irons	Electric Cigar Lighters
Electric Chafing Dishes	Electric Coffee Percolators
Electric Vacuum Cleaners	Electric Toys
Electric Lamps	Electric Portable Drills
Electric Washers	

A glimpse at the size of the industry can be obtained from the following figures, which are conservative:—

Number of homes wired, 8,000,000.

Increase in number wired, 250,000 to 300,000 per year.

Up to 1918 about 10,000,000 household electric appliances had been sold. From July, 1917, to July, 1918, about 332,000 vacuum cleaners were sold.

In 1918 686,000 heating and cooking appliances were sold through electrical channels.

In 1919 about 200,000 individual farm lighting plants will be sold.

In 1919 there were 3,000 manufacturers of electrical devices.

Out of about 15,500 hardware dealers rated at over \$5,000 in this country, only about 2,500, or 16 per cent., are selling household appliances.

In the early days of the washing machine business the manufacturers distributed a large proportion of their production through the hardware trade, jobber and dealer. The relation which was developed between the hardware dealer and jobber and the manufacturer was, and still is, equitable and profitable to all parties concerned.

During the last several years, however, the proportion of the production of the washing machine industry distributed through the hardware trade, dealer or jobber has declined and not increased. This is an unfortunate condition; and yet, it is a fact which you gentlemen should face and endeavor to remedy. If the manufacturers are at fault for this condition, they would like to know it. If the hardware trade is at fault, then, surely, you, gentlemen, would like to know it.

The present demand for household labor-saving devices, electric or driven by other kinds of power, is far in excess of supply. Numerous manufacturers of these devices have doubled their producing capacities and deliveries within the past year. They are using every intelligent, legitimate effort to increase production, and they are getting results, in spite of handicaps merely suggested by the phrases "labor problem," "transportation difficulties," "shortages of basic materials," such as motors, wringers, polished and trimmed copper sheets, etc. In our industry alone, we can show results in the way of increase of deliveries, by units and not money, of over 95 per cent., comparing our deliveries by units second quarter of 1918 to second quarter of 1919. These are facts beyond dispute which show that the house-

hold specialty industry is a growing one which you gentlemen cannot and dare not neglect.

Today, with all of the increase in production, the manufacturers of household labor-saving devices are far behind on orders. The demand for these devices has just started. The hardware trade, to some extent, is cashing in on the demand today, but it must prepare itself to meet the demand of tomorrow and the conditions of tomorrow. What will the demand be tomorrow and what will the conditions be tomorrow?

Every user of a hand, water or gasoline power household labor-saving device is an excellent prospect for an electric power device as soon as the home is wired. The rate at which homes in this country are being wired is remarkable.

The women of this country are directing their energy toward the factory and the office and away from the household duties. Everybody is urging increased production to reduce the cost of living. Women are doing more than their bit in this job to increase production; and as the scope of their work develops and broadens they will have less time to devote to household drudgery—and, under present conditions, drudgery is exactly the word to use in describing household work. These women are learning about machinery, production, labor-saving machinery, the planning of factory work—and they are fast losing their fear of machinery of any kind or description.

Who or what will clean and iron the clothes, wash the dishes, clean the rugs, cook the meals, etc.? Household servants and washwomen are now so scarce, in a relative way, that they are demanding and getting fortunes for their services. The sky only is the limit by which they set their daily wage. The answer is—washing and ironing machines for household use, electric dish washers, vacuum cleaners, toasters, ranges, etc.—the whole series of electrical household specialties for use in the city and in farm homes by reason of individual farm lighting plants.

The demand for these devices will greatly expand; because we are not developing a servant class in this country. Unlike in England and in France, your wife or my wife cannot find a servant who is or will be proud of her job and proud of the fact that she works for you or for me. Servants' and maids' unions may be formed here as they have been in England and France; their hours of work and rates per hour may be standardized here as they have been in England and in France; but the fact remains that, in a relative way, good household servants are as scarce as hen's teeth, and that we are not developing a servant class in this country. Add to these facts the proposed restriction of immigration and you get but a glimpse of the possibilities of making money by distributing labor-saving devices.

Household servants are making it a condition that the home be furnished with labor-saving machinery if they are to stay. The housewife, if she has no servants, now realizes how much more of a necessity these labor-saving devices are. On the point of solving the problem of clean clothes for the family, she knows, only too well, that the most economical and the most sanitary way of getting clean clothes for the family is to have the washing and ironing done in her own home. She has had all she wants of the public laundries.

The war has done more to increase the use of household labor-saving devices than anything else could have done.

What will be the conditions under which these household labor-saving devices will be sold?

The jobber or the dealer handling most of these articles today is in a position to pick and select his customers. Demand exceeds supply. Deliveries, because of shortage of certain basic raw materials, in many cases, are slow and uncertain. The jobber or the dealer who takes his dis-

counts is getting the better service. He, in turn, selects the customer who takes the discount and who pays cash. The whole industry is being placed on a more solid basis and foundation. Plans for financing customers who purchase on deferred payment plans have been developed which will adequately and properly protect both dealer and customer. Here is an industry with unlimited powers of expansion, with possibilities indescribable. Its product is an absolute essential under modern living conditions. Properly planned, the industry will develop on a most solid foundation. Manufacturers of automobiles now sell their product cash against documents. Why shouldn't the manufacturers of these electrical household specialties do likewise? By so doing, they will develop for themselves a most responsible group of jobbers and dealers who can adequately cover their respective territories and who will make out of their distributive function real profits commensurate with the opportunities now open in this great field of industrial endeavor.

Gentlemen, an opportunity is now knocking at your door. Properly welcomed and developed it will make for you and your companies real profits far in excess of any you have ever dreamed could be made on the distribution of household appliances. This distribution field is before you; it is open to all alike; it awaits your intensive cultivation. If you do not start to work on it, others will. Don't wait too long.

Banfields' Metaloid Fixtures

A new line of lighting fixtures which promises to be in good demand is the "Metaloid" range, now being produced by W. H. Banfield & Sons, Limited, Toronto. These fixtures have all the massive appearance of fixtures made from cast brass, and, at the same time, we understand, will retail at practically the same price as cheap stamped fixtures. The range includes 2-light, 3-light and 4-light fixtures, all of the same pattern; also a 3-chain hanger for semi-indirect lighting and brackets in round or link end. They are being supplied in various finishes such as bright flemish, bronze and gilt, rich gold and matt, rich gilt and matt and brushed brass. These fixtures are guaranteed not to tarnish, as it is claimed they will retain their finish quite as well as fixtures made from brass, bronze or copper. Samples may now be seen at the company's show rooms, 80 King Street West, Toronto.

Will Hear Goodwin at Buffalo

An electrical show is being held at Buffalo on October 24 and 25, Friday and Saturday. Mr. W. L. Goodwin is one of the attractions, and a number of Toronto, Hamilton, Brantford, Kitchener and Waterloo delegates have signified their intention of running over to the show and gathering in a little more inspiration from the magnetic Goodwin. Mr. Goodwin speaks on Friday evening, and present indications are that the delegates will have to spend one night in Buffalo.

Increasing Shawinigan Capital

Shareholders of the Shawinigan Water & Power Company have approved of the by-law passed by the directors in July last providing for the creation and issue from time to time of first and refunding, sinking mortgage bonds to a maximum of \$50,000,000.

The Automatic Electric Company, Toronto, Albert P. Lintz, general representative, have been awarded the contract for equipping automatic telephones and code call system in the plant of the Sheet Metal Products, Limited, Toronto.

Electrical Contractors Meet in Brantford

On Tuesday, September 30th, an interesting meeting of the Telephone City Electrical Club was held in Brantford. The majority of the Brantford members were present, Mr. V. K. Stalford and Messrs. Culley and Reid of Hamilton, and the full membership of the Twin City Electrical Club, which includes Kitchener and Waterloo. Mr. K. A. McIntyre, chairman of the Toronto District was also present and addressed the contractors briefly, outlining the organization and history of development of the National Association of Electrical Contractors and the Ontario Association. The Brantford meeting was called primarily to discuss the matter of affiliation of the three associations represented, as districts of the Ontario Association. At the close of the meeting a roll call was taken to get the opinion of the members which showed that there was no one actively opposed, though a number asked time to consider the matter a little further. The majority of those present, however, expressed themselves as heartily in support of affiliation. There were some complaints that the local association had not fulfilled the mission for which it had been found but it must be remembered that the value of the small association depends very largely on the success of the larger movement, which will bring all the local organizations together into one big provincial association. Members frequently ask the question, "what will I get out of being a member of the association" or "what did associations ever do for me." This, however, in our opinion, is not quite the correct attitude. We believe the members should rather ask themselves, "what means will these organizations provide for me to get something more out of my business than I am getting at present." The value of an "association" is something like advertising. It is difficult to trace immediate results directly to it. There is no doubt, however, about the ultimate gain. The Ontario Association is being organized along sound lines and there is no contractor who will fail to feel the benefits in his business, if he throws himself heart and soul into the organization, puts his shoulder behind the officers and comes forward to take his share of the work on occasion, instead of leaving it for somebody else. At best, no man should condemn an association as useless until he has given it a fair chance to show its usefulness—that means, until he has performed some useful work, himself, in the association.

Toronto Contractors Urging Technical Education of Workers

The Toronto District of the Ontario Association of Electrical Contractors & Dealers are co-operating with the Toronto Technical School in an endeavor to have the apprentices of the former attend a suitable course at the school. At the first meeting of the season, held in the King Edward Hotel, a number of the contractors expressed themselves as heartily in favor of all their apprentices taking an electrical course at the Technical school and stated that in the majority of cases the men showed themselves eager to take this course. Mr. McIntyre explained that a special class was being formed to take care of the electrical contractors' apprentices and particularly the returned men. The Technical school authorities had expressed themselves as willing to consider any change in their regular curriculum that the contractors might find necessary in order to render it more exactly applicable to the needs of men who would be engaged in practical electrical installation in residences, factories and other buildings.

Steps are being taken to collect all information as to the number of apprentices at present taking this course, and a card, of which the reproduction below is a duplicate, is being filled in by each employer for each one of his ap-

Toronto District—Ontario Association of Electrical Contractors and Dealers

TECHNICAL EDUCATION OF ELECTRICAL APPRENTICES

Card being filled in by employers

prentices. These will be filed in the secretary's office for reference. All contractors are urged to send in their cards without delay.

It is interesting to note that the Toronto contractors are taking this important step in the direction of educating their apprentices to be better workmen. Mr. Gunn of the Electrical Workers' Union, who was present and spoke briefly, expressed himself as heartily in favor of the move as tending to increase the standard of the worker. Mr. Gunn also strongly advocated the licensing of the electrical worker, thus showing himself to be entirely in unison with the views expressed on a number of occasions by the contractors themselves. It is to be hoped that the united efforts of the contractors and the electrical workers will result in the near future in some form of licensing being adopted.

This first meeting of the association was well attended and the indications are that the winter's work will go forward enthusiastically.

Announcement has been made that the Domestic Engineering Company, of Dayton, manufacturers of Delco lighting and power plants, has been taken over by the General Motors Corporation.

The Synchronized Induction Motor

(Concluded from page 41)

(3) That the power factor with salient pole rotor is always lower than as an induction motor.

(4) That efficiency may be higher or lower than as an induction motor depending solely upon the frequency and flux density.

(5) That pull out torque being independent of frequency, varies as the square of the flux density.

(6) That on high densities slip is greater with salient pole rotor than as a standard induction motor. Vice-versa with low densities.

In synchronizing the motor under load (i.e. a load demand of less than that at which the motor pulls out of synchronism) it is necessary to raise the voltage impressed on the stator of the motor to probably twenty per cent. above normal until the motor pulls in and then lower the voltage to the normal value.

When the motor is running "out of synchronism" it emits a pulsating humming noise and the frequency of these pulsations is proportional to the slip, one beat occurring each time a pole on the rotor passes an area of greatest stator flux density. When in synchronism these pulsations cease and the motor runs even more quietly than as an induction motor.

Electrical Goods Sell Best on the Instalment Plan—How They Do It In the U. S. A.

The problem of financing the instalment plan has been solved for the U. S. contractor by an arrangement between the Association of Electrical Contractors and Dealers and the Morris chain of banks—under what is known as the Morris plan. There are 102 Morris plan banks or companies located throughout the United States. The contractor explains the situation to the housewife in some such advertisement as follows:

We Actually Increase the Purchasing Power of Your Dollars.

You Can Buy Our Washing Machines At
CASH PRICES ON TIME PAYMENTS
Through Our Arrangement With The Morris
Plan Company

NO RED TAPE—NO DELAYS.

Here is the whole story in a simple example:
You wish to buy a washing machine worth
\$125.00, cash price.

You pay down	\$ 25.00
To extend ten month's credit to you on the remaining \$100, the Morris Plan Com- pany charges 6 per cent. discount, which is	5.00

Total cash paid by you	\$ 30.00
You pay \$10 a month for 10 months to the Morris Plan Company	100.00

Total cost	\$130.00
----------------------	----------

This means a saving of from 20 per cent. to
33 1/3 per cent. over the prices you would be forced
to pay at Instalment Stores.

The housewife, already familiar with the numerous advantages to be gained from owning a washing-machine, now sees her way clear to buy one on reasonable monthly payments, at a price which is right.

When she has paid \$30 in cash, she signs a Retail Trade Acceptance for the remaining \$100, which the merchant endorses and the bank discounts at 6 per cent. Thereafter, the bank handles the entire transaction, relieving the merchant of all details of collecting and recording the time payments. For the privilege of being relieved of these details, the contractor-dealer pays a service fee to the bank at a fixed rate, according to the amount of the purchase. In the example above, the rate is 2 per cent. Thus, a merchant receives a total of \$93 for the Retail Trade Acceptance and a total of \$123 cash for the sale of the machine.

Can Continue Cash Business.

The Retail Trade Acceptance is accompanied by a Conditional Sale Agreement, providing for a lien on the goods. Both the agreement and the acceptance are on the same sheet of paper and the customer signs her name only twice. The goods are protected by fire insurance obtained for 1 per cent. of the selling price, which is usually included in the selling price.

The great advantage of The Morris Plan to contractor-dealers is that it enables them to conduct their business on

a cash basis and at the same time to increase the volume of their sales by extending the benefit of time payments to their customers at prices lower than can be fixed by instalment houses with capital tied up in hundreds of outstanding accounts.

The rapid growth of the plan is accounted for by the fact that the contractor-dealer who discovers its possibilities immediately devotes a large part of his local advertising to advantages which it offers to customers. Hundreds of local newspapers thus carry daily displays making in the aggregate a great national campaign. Nearly all of these advertisements are simple and direct although they feature a great variety of articles for sale.

The advantages which may be gained by use of The Morris Plan in sales of electrical supplies also apply to the business of house-wiring contracts. The principles of the plan as applied to housewiring contracts are the same as in time payment sales of merchandise, but there is a slight difference in the detail of operation owing to the fact that in the time payment sale, one of the most important elements is a lien on the merchandise, whereas it is not feasible to obtain this in a house-wiring contract.

The plan is, therefore, to base all financing of house-wiring contracts on the credit of the contractor-dealer and his customer and to dispense with the lien. Under this plan the contractor-dealer draws a Morris Plan Retail Trade Acceptance on his customer, which, upon being accepted by the customer, is turned over to The Morris Plan bank with the contractor-dealer's endorsement and he receives the net proceeds. In lieu, the contractor-dealer makes a deposit with The Morris Plan bank, this deposit being non-withdrawable until the customer has paid the Trade Acceptance in full, and on all such deposits the bank allows interest.

Must Have Good Reputation.

The Morris Plan banks throughout the country emphasize three facts. Before they will give a credit rating to a contractor-dealer and do business with him, they must be satisfied that his goods and service have already won for him the confidence of the community. Only articles which are of real utility are sold through the plan. The Morris Plan banks expect the contractor-dealer to sell such articles only to purchasers who have a reputation for meeting their obligations and the banks reserve the right to reject the account of any person who, in their opinion, would not meet his payments and thereby make it necessary for the merchant to settle the obligation.

The inauguration of this system of financing has marked a great advance in time payment merchandising, which, up to now, has been one of the loose ends in American business. Through the plans, a merchant can increase his volume of business and his profits as a brief calculation with pencil and paper will readily show. If he has been able to turn over a capital of \$50,000 four times a year, he can, with the aid of The Morris Plan Retail Trade Acceptances, turn over the same capital at least eight times a year through obtaining cash from increased sales resulting from the offer of time payments to customers.

The plan satisfies customers because they see clearly that they are buying at cash prices and paying only 6 per cent discount for the benefit of a year's credit.

Should Develop New Business

Progressive merchants in cities where Morris Plan banks are located are now adopting The Morris Plan. Those who are first to adopt it in a new community appear to be obtaining a decided prestige over competitors and their monthly sales reports are the best proof of the ease and

safety with which a large amount of new business may be developed.

In the opinion of many merchants, some of whom have used the plan for more than one year, a contractor-dealer should develop a large amount of new business which he could not obtain without the aid of some such system of financing time payments; he can obtain spot cash for this business, make a large addition to his yearly profits, and at the same time, be free from the burden of all detail in connection with the time payments since The Morris Plan bank takes this off his shoulders.

The interesting diagram shown herewith is the method adopted by "Electrical Merchandising" to illustrate more clearly the plan of financing house-wiring contracts on this time-payment basis. This particular job costs \$300. On the completion of the job the contractor draws up a "trade acceptance" on his customer, which is accepted by the customer and turned over by the contractor to the bank. In this case the trade acceptance is for \$270, which is accompanied by a cash payment of \$30 and a discount payment of \$16.20, a total of \$46.20. The third step in the operation is the transfer of this \$270 trade acceptance to the bank. The contractor keeps the \$46.20. The bank deducts from the \$270 trade acceptance the discount of \$16.20, a 10 per

cent. deposit of \$27, and a service charge of \$8.10, total \$51.30, and returns to the contractor the balance, \$218.70. The contractor has now received \$218.70, plus \$46.20 = \$264.90, and has on deposit \$27 at the bank. From now on payments are made by the customer direct to the bank, which, in this case, amount to a \$17 first payment, and eleven consecutive monthly payments of \$23. When the customer has paid up in full, the \$27 bank deposit is returned to the contractor, with interest at 5 per cent. The contractor thus gets his full \$300, less the service charge of \$8.10. A similar plan is offered to contractors for financing the sale of electrical appliances.

New Line of Induction Motors

R. E. T. Pringle is distributing catalogue No. 6, describing, with illustrations, their new line of induction motors, manufactured by the St. Louis Electrical Works, St. Louis, Mo. The list comprises single, 2 and 3-phase motors, 25 to 60 cycles, 110 to 440 volts in sizes ranging from 1/8 to 20 h.p. It is claimed that the efficiency of the St. Louis motors is exceptionally high along the whole range of sizes, and that a 1 h.p. has practically as high an efficiency as the 20 h.p.

A wiring job costing \$300 is diagrammed in this chart, illustrating the Morris Plan proposal for financing time payments on house-wiring. The plan involves three parties: The contractor, the customer and the Morris Plan bank. The arrows indicate the direction of the actions in financing the deal. The numbers on the arrows indicate the sequence of the action. For example: A contractor sells to a customer a \$300 job. The customer returns to the contractor a cash payment of 10 per cent. of the cost (and in this case including the discount) and a trade acceptance for the balance. The contractor retains the cash payment and discount. He

sends the trade acceptance to the bank, which deducts the discount, the service fee, and the 10 per cent. deposit, and sends the proceeds back to the contractor. On the same day, the bank sends a letter, coupon book and full instructions to the customer, who in turn makes his monthly payments to the bank. Thus the customer has the advantage of buying at a cash price on a time payment basis; the contractor obtains all of his money except a 10 per cent. deposit which is refunded at 5 per cent. interest when the customer has made all his payments; and the bank has made a profit on its deal.

What is New in Electrical Equipment

Cuts Down Your Light Bills

Where the price of electric current per kw.h. is a factor of any considerable importance in the sum total of one's monthly bills, the appliance illustrated herewith is of very real value in reducing those bills. This is an appliance which gives a graded amount of light, and, of course, at the

same time uses graded amounts of current. By a slight touch of the chain some twenty gradations from full "on" to "out" are obtainable, and though consumption of current is not exactly in proportion to the amount of light given throughout the whole range, the saving is very considerable indeed. The actual facts in connection with consumption and saving, using this device, were recently published by the Bureau of Standards as follows.

Position	Watts Consumed	Full Watts %	Candle-power	% Full Candle-power
1 ('On')	39.8	100	37.3	100
2	39.2	98.5	34.0	91
3	38.8	97.5	32.3	86.5
4	37.4	94	25.9	69.5
5	35.2	88.5	17.4	46.5
6	30.9	77.5	7.7	20.5
7	27.2	69.5	3.6	9.6
8	26.3	66	2.5	6.7
9	23.6	59	0.85	2.3
10	21.1	53.5	0.7	1.9
11	20.0	50	0.33	0.9
12	19.2	48.5	0.23	0.7
14	16.3	41	Below	0.1
15-16-17-18	Not Recorded.			
19 ('Out')	9.6	24	Barely Incandescent	

This dimmer, which has been given the trade name of "Anylite," is manufactured by the Anylite Electric Company, Fort Wayne, Ind., and distributed in Canada by the Dominion Battery Co., 736 Dundas St. E., Toronto.

Hangers for Bowl Fixtures

The accompanying illustration shows rosettes and loop designed and placed on the market by the Plume & Atwood Manufacturing Company, Waterbury, Conn., for hanging

bowl-type lighting fixtures. The loops are made in 3-in. to 5-in. lengths to accommodate differently sized bowls.

The "Amco" Industrial Unit

An original idea in fixture lighting equipment is shown herewith. The filament in the nitrogen lamp centres at the waist-line of the lower member—the exact focal point of the lower bowl—which causes the illumination to stream down upon the work table, lathe, etc., as intensely as if subjected to the headlight of a powerful automobile. The light in the upper hemisphere of the filament which is more or less lost in the holder of the ordinary reflector equip-

ment, is reflected outwards by the upper member to illuminate the vertical plane. This gives the result of two lights in one. Being so designed and of all-porcelain enamelled steel, there is no possibility of misplaced light or glare.

The distribution of this equipment in Canada is in charge of Mr. Frank T. Groome, room 1710 Royal Bank Building, Toronto. Mr. Groome's intimate knowledge of good lighting and good lighting equipment is well recognized and will establish confidence in this new line.

The S. Morgan Smith Co., York, Pa., have closed a contract for the supply of a 2,000 h.p. horizontal turbine to the Electric Reduction Co., Buckingham, P. Q. This will be direct connected to a generator. The company is adding a new unit to the equipment.

"Equator" Heat

The Equator Manufacturing Company, of Hamilton, Canada, are manufacturing an air heater following the design shown in the accompanying illustration. This particular type of household appliance is finding a very ready

sale in the average household where its operation is becoming general during the late autumn, as a means of holding off the date of starting up the troublesome coal furnace. The company also manufacture a useful little toaster which consumes 550 watt hours. It is sturdily built and suitable for use on the table or elsewhere.

Attachment Used to Electrify Candle Sticks.

William R. Noe & Sons, New York City, have developed a device called the "Lenox" attachment, which is used for the purpose of electrifying candle sticks, so that they can be used as portable lamps. As shown in the accompanying illustration this device consists of a rubber cork

mounted on the lower end of a lamp socket. When once inserted in a candle stick this attachment cannot be accidentally pulled out. Turning the device to the right when inserting it causes the rubber cork to expand so that it will fit any candle stick. The metal part of the attachment is furnished in brass or nickel.

A Lamp that Clamps or Stands Anywhere

In addition to the Polar Cub line, a very attractive device, handled by the Gilbert-Menzies Company, is the Wal-

lace lamp. This is a lamp that will hang or stand in any position with an adjustable feature which enables light to be directed in any required direction.

An Overhead Fixture Where You Want It

The usual form of overhead lighting fixture cannot be readily moved from one position to another; it occasionally conflicts with overhead shafting, machinery, etc., and it does not always give illumination where it is wanted. To avoid these objections, the "Electrical World" describes how one large industrial plant in Connecticut has made its general

overhead lighting equipment semi-permanent in position. To do this the conduit supplying the lamps has been run in the usual manner to symmetrically placed outlet boxes, but instead of placing the lamps directly under the outlet boxes, they are suspended from hooks placed at any desired distance from the outlet box and connected therewith by twin-conductor cord and a plug connector. The lamps proper are supported several feet from the ceiling. So as to avoid the objectionable features of drop-lamps, each

Personals

Mr. J. S. Gould, Smiths Falls, Ont., is the Conservative candidate in South Lanark at the coming provincial election.

Mr. Wills MacLachlan was elected chairman of the Public Utilities Section of the National Safety Council at the recent convention of that body held in Cleveland.

Society Plans All-Electrical Christmas

The Society for Electrical Development has announced a campaign to make this an All-Electrical Christmas. Representatives of the Society have just completed covering sixteen States and the Province of Ontario, during which electrical conditions in every branch of the industry were studied at close range. In most cities the contractors, dealers, jobbers and manufacturers reported the greatest volume in their history. Manufacturers and distributors of electrical specialties, particularly, are far behind on orders as dealers in these devices are finding ready sale. As one retailer expressed it: "For the first time in the history of electrical appliance selling in this city, people are coming into the store to buy large and expensive specialties, which heretofore we had to go out and sell with the hardest kind of selling."

Based upon this information, the Society has prepared complete and comprehensive sales and advertising material for holiday selling. This material will comprise a beautiful poster in many colors, colored leaflets, envelope enclosures, cards for counters, cars and windows, form letters and various other advertising matter. It is planned to distribute this co-operative help to the trade at large, as in the past Society campaigns. The Society will gladly supply details of the campaign and material upon request.

E. A. Lowry Power Equipment Co.

The E. A. Lowry Power Equipment Company has made application to the Ontario Government for incorporation under the name The E. A. Lowry Power Equipment Co., Ltd. Under the new charter this company will conduct a sales business in all kinds of electrical power equipment machinery, etc. The authorised capital is \$50,000 with head office in the Herald Building, Guelph. The old company has been in existence for nearly five years and is now incorporating owing to the large increase in the business, which has become thoroughly established throughout the Dominion. Mr. E. A. Lowry will be president and manager of the new company, and Miss M. M. Malone, secretary.

The town of Wolfville, N.S., some time ago purchased the plant and goodwill of the Acadia Electric Light Company. They are now spending \$25,000 to provide necessary improvements.

The St. Louis motor, handled by R. E. T. Pringle

Current News and Notes

Carleton Place, Ont.

Mr. G. A. Burgess, of Carleton Place, Ont., has been granted permission to bring electric power from Blakeney to Almonte to operate a flour mill in that town.

Glencoe, Ont.

The ratepayers of Glencoe, Ont., will vote on the question of securing a supply of Hydro-electric power for that village.

Hamilton, Ont.

The Hamilton Lamp Company have commenced manufacturing tungsten lamps at 144-146 York Street, Hamilton. Mr. George F. Webb is at the head of the company which is capitalized at \$300,000.

Lakefield, Ont.

The ratepayers of Lakefield, Ont., have passed a by-law authorizing an expenditure of \$26,000 for a supply of Hydro power in the village.

Ottawa, Ont.

Acting under the direction of the Water Power Branch of the Department of the Interior, a hydrometric survey staff will be organized and put to work to systematically ascertain the various water power resources of all the provinces of the Dominion. It is understood Mr. Stuart S. Scovill, B.Sc., will be the chief engineer, with Mr. James R. Bissett, B.Sc., as assistant engineer.

Peterboro, Ont.

Work has commenced on the construction of a transmission line from Healey Falls to Peterboro. Norwood and Havelock will be provided with light and power by this branch of the Hydro-electric System, and the farmers in surrounding districts will also be able to take advantage of the line.

St. Thomas, Ont.

The St. Thomas Hydro-electric System have received applications from 168 farmers in the Yarmouth district for Hydro service on their farms. It is expected about 400 h.p. will be required to serve this district. The farmers of Southwold township are also negotiating.

Toronto, Ont.

A start has been made on the construction of a building for the University of Toronto which will house the electrical laboratories and kindred science departments. It will be ready, it is expected, in about a year.

Judge Barron, of Stratford, has been appointed by the Minister of Labor a commissioner under the Inquiries Act for the purpose of investigating the cause of, and placing the responsibility for, the strike of the Toronto Electric Light Company's employees on September 3 last.

Truro, N.S.

Ratepayers of Truro, N.S., have voted an expenditure of \$50,000 for the purpose of improving and extending the electric light and power plant.

Uxbridge, Ont.

At a special meeting of the Uxbridge town council recently it was decided to introduce an enabling by-law for Hydro-electric light and power.

Wingham, Ont.

A movement is on foot in Wingham, Ont., to have a by-law passed authorizing the expenditure of \$40,000 for building a plant and sub-station to bring hydro-electric power from Eugenia Falls.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

- "American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$3.00.
- A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$3.00.
- A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price \$2.00.
- Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$1.00.
- "Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.
- Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$3.00.
- Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price \$2.50.
- Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price \$1.00.
- Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price \$2.00.
- Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price \$2.00.
- Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.
- Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.
- "Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$6.00.
- Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.
- Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.
- Electric Power Transmission, Principles & Calculation, by Alfred Still. 2nd Edition, revised, enlarged and rewritten. Just published by McGraw-Hill Book Co., Inc. 407 pages, illustrated. Price \$3.50.
- Elements of The Infinitesimal Calculus, by G. H. Chandler, M.A., Prof. Applied Mathematics, McGill University, 318 pages, cloth bound. Published by John Wiley & Sons, 1907. Price \$1.40.
- Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price \$1.00.
- Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.
- Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price \$1.50.
- Examples in Alternating Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$2.00.
- Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price \$1.00.
- First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.
- "Fuel," by C. F. Herington, recently published by D. Van Nostrand Co. 211 pages, with 84 illustrations. Price \$3.00.
- Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.
- How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.
- Induction Coils in Theory and Practice, by Prof. F. E. Austin. Published this year by the author. 64 pages, illustrated. Price \$1.00.
- International Library of Technology, Vol. 11.B, on Electricity and Magnetism, Electrodynamics, Electrical Resistance and Capacity, The Magnetic Circuit, Electromagnetic Induction, Chemistry and Electro-Chemistry, Primary Batteries, Electrical Measurements, 585 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.
- International Library of Technology, Volume 14-C on Storage Batteries, Incandescent Lighting, Arc Lighting, Interior Wiring, Modern Electric Lighting Devices, Electric Signs, Electric Heating, 540 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.
- "Powdered Coal as a Fuel," by C. F. Herington, recently published by D. VanNostrand Co. 211 pages with 84 illustrations. Price \$3.00.
- Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.
- Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.
- Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.
- Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.
- Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.
- "Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.
- Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.50.
- Standard Wiring, 1919 Edition, 25th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.
- Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 168 pages, illustrated. Price 50c.
- Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price \$1.00.
- Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.
- Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.
- Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price \$2.00.
- Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price \$1.00.
- Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.
- The B.I. Hand-Book, published by British Insulated & Helsby Cables, Limited. Second edition. 448 pages, illustrated. Price \$1.00.
- The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.
- The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.
- The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price \$2.50.
- "The New Competition," by Arthur Jerome Eddy, 6th revised edition, price \$1.60.
- The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.
- The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.
- Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price \$1.00.
- Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price \$1.00.
- Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.50.

Publisher's Notice

Advertisements under "Situation Wanted" or "Situation Vacant" are charged at two cents a word per insertion, minimum charge 50 cents.

Advertisements for tenders, equipment, wanted or for sale, etc., or miscellaneous, are charged at \$2.80 per inch.

All advertisements must be in the publisher's hands by the 10th or 23rd of the month to insure insertion in the subsequent issue.

WANTED — TECHNICALLY TRAINED MAN with view to taking up designing of electrical apparatus, principally A.C. motors. An opportunity for the right party. Box No. 27, Electrical News, Toronto. 19-22

ARMATURE WINDERS—ONE FOREMAN, give experience, references, and salary required. Scott Bros. Electric Co., Windsor, Ont.; Detroit, Mich. 19-20

WANTED—A number of first-class armature winders; steady work. Apply The Canadian General Electric Co., Ltd., Peterborough, Ont. 20-21

WANTED—ASSISTANT ELECTRICAL ENGINEER for municipally owned Light and Power System in fast growing Ontario city. Duties to commence as soon as possible. Box 36, Electrical News, Toronto, Ont. 19

Motors For Sale

We have for sale about 100 D. C. motors, ranging in size from 5 H. P., 1600 r.p.m., to 100 H. P., 430 r.p.m.

These are Canadian General Electric, Chapman & Walker Ltd., and Canadian Westinghouse Company, Ltd. motors.

They will be disposed of under a guarantee of good running condition and prices and terms will be made to suit.

All are offered subject to prior sale. Itemized list furnished upon request. Write,

Transformers

We now have a well-equipped shop for the repair of service transformers up to 50 K.W. capacity.

This is our specialty and we have had considerable experience along these lines.

Instead of discarding burned-out transformers, send them to us for expert repairs. We are prompt and can give satisfaction.

E. J. GROVES,
Box 422, Parry Sound, Ont. 20-t.f.

EASILY SOLD

is what the dealers who handle the Eden have to say about it, with good profits, too, they add.

And they are right.

The sales of Eden Machines have increased by leaps and bounds during the past year. Women everywhere are being educated to the fact they need not be kitchen drudges, so they are buying Washing Machines and their preference has been

THE EDEN

the time tested machine with the all metal body, and its twenty-five points of superiority.

You Can Trust Griffiths' Products

"ANTI-SULPHURIC" ENAMEL

The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"

Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"

Oilproof enamel. Dries quickly over greasy and oil surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"

Fire resisting paint, or colorless solution.

"ARMACELL"

Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"

Black, quick air drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"

for coloring electric lamps. Used in the Royal Navy. Weather-proof. Dries rapidly.

"ARMABRON"

Bitumen protective paint, elastic, acid-resisting, weatherproof.

POCKET SIZE
LEATHER COVER

"STANDARD WIRING"

TELLS YOU HOW

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or A. C. single, two or three-phase.

OUTSIDE—Line construction, line wires, service wires, poles and their dimensions and Insulators, guard arms, guy wires, how to install Lightning arrest-

weights, and how to erect and protect them and anchors. Tree wiring, splicing, service and wires. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to run wire. How to find the proper size of wire for current, voltage and drop, either by formula or by the tables of the book. How to wire for two-phase and three-phase with formulae and tables in a simple manner that anyone can understand, through partitions and walls and around corners and roundings exist. When and how to do it. How to take. The proper way to run wires in walls, Outlet, Junction and Switch boxes, complete interior conduits, Concealed knob and tube electric and combination electric and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and other lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination. Where each should be used. Illumination required for various classes of service from shops and window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

ECONOMY renewable FUSES

are the *right* fuses to protect *your* electrical circuits—

- because they afford the right sort of protection; their reputation lends assurance that you can safely depend on them for accuracy of rating and all-round efficiency in operation.
- because they cut annual fuse maintenance costs 80% as compared with the use of one-time fuses, owing to the fact that an inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.
- because it's the work of a moment to replace the link and renew the fuse.
- because a good sized stock of "Drop Out" Renewal Links always on hand represents but a small outlay.

ELECTRIC ARC WELDERS

have paid for themselves and more, in Railroad and Boiler Shops, Bridge Works and Shipbuilding Plants, Steel and Malleable Iron Foundries.

They have also been successful with Mining Companies, and manufacturers of Agricultural Implements, Safes, Conveying Machinery, Drop Forgings, Automobiles, Tanks, Pressed Steel, etc.

We operate a shop in Toronto for demonstration purposes and to handle all classes of repair work in the shop or outside.

MOTORS

Our stock of 25 cycle 550 volt

New Lincoln Motors

has been pretty well depleted on recent orders, but new shipments are on the way and we aim to keep motors of the following H. P. and speed in stock:

$\frac{1}{2}$, 1, 2, 3, 5, $7\frac{1}{2}$, 10, 15 at 750 and 1500 R.P.M.
20, 25, 30, 35 at 750 R.P.M.

The following is a list of used and odd sizes on hand:

	H.P.	R.P.M.	Cycle	Volt	Make
1	1	750	25	550	C. G. E.
1	10	1500	25	550	Westinghouse

"Profit Savers"

on every job of interior wiring

Phantom View

Walger 3-Way

Use it to tap feed wires in outlet boxes, condulets, and on knob and cleat work. It is the quick easy way.

Actual Size

Walger Connectors

A quick easy way to cut your connection costs—use Walgers. Just loosen the cap and turn back the screws—it is only work of a minute.

Eliminates blow torch, solder and tape. Walger simplicity makes it the quickest, the easiest, the safest of any type of connection.

Once in place the Walger takes a sure grip, and every connection is perfectly insulated. Cuts your connection cost right in half.

Approved

by the National Board of Fire Underwriters and the Hydro Electric Power Commission for No. 12 and all smaller wire.

Send for Sample To-day

The minute you get a Walger in your hand you will see for yourself just how it will save. In these days of high prices here is an economy worth while.

Walger 2-Way

Wherever there are connections to make on any interior job you can do them easier, quicker, and cheaper with Walger Connectors.

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

HIGH GRADE BALL BEARING INDUCTION MOTORS

Single Phase Two Phase Three Phase

In these St. Louis Motors the usual induction motor trouble is eliminated by their having ball bearings instead of the ordinary sleeve bearing. The ball bearings are of the very best grade and have absolute protection from dirt or grit penetration.

Due to the torque characteristic of the St. Louis motor, there are exceptionally low losses in the stator iron and copper, and there is greater starting torque on much less starting current.

The motor is bolted to a separate base, with motor frame so confined that it is easily applied to the machine or appliances.

Ruggedness and simplicity of design, exclusive construction of rotor, centrifugal switch, terminal leads and low temperature rise are among other features that commend the St. Louis motor for the most efficient and economical service.

Electrical News

Generation, Transmission and Application of Electricity

These Four Exclusive Points of Advantage

Form the Basis of the Tremendous Success of the

BUSS Renewable FUSE

Point 1

Terminals are seated in long metal grooves. Impossible for terminals to be out of line. Long seat prevents any possible strain on fuse link. Seating of terminal makes unnecessary any indented or odd shaped washers that must be properly seated to assemble the fuse.

Point 2

Self-Aligning Element. No renewable fuse can be put together when the terminals and link are not assembled in a straight line, yet, the BUSS FUSE IS THE ONLY ONE IN WHICH ARRANGEMENTS HAVE BEEN PROVIDED TO ENABLE AND GUARANTEE THE ASSEMBLY OF THE ELEMENT IN A STRAIGHT LINE.

(Link sets between lugs on terminals. Link cannot be pulled out of line when bolts are pulled up tight).

Point 3

Metal Ring Inside of Tube. The metal ring for holding the cap and terminals is fastened INSIDE the tube. THIS MAKES THE BUSS FUSE THE ONLY ONE ON THE MARKET NOT AFFECTED BY THE SHRINKING OR SWELLING OF THE FIBRE.

(The more the fibre shrinks, the tighter the ring is held. Consequently, the fuse always remains tightly closed, preventing the escape of flame and gases).

Point 4

Floating Element. In assembling the terminals and link on a renewable fuse, a variation in length as much as $\frac{1}{8}$ " occurs. This is due to the clearance in the screw holes in the link and terminals. Due to shrinkage of fiber, variations in length of the case also occur. THE BUSS IS THE ONLY ONE IN WHICH MEANS ARE PROVIDED FOR AUTOMATICALLY COMPENSATING FOR THESE VARIATIONS.

(This is accomplished by making the slot in the terminal much wider than the thickness of the washer seated therein, thereby permitting a limited movement of the terminal).

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Accurate—Rugged—Inexpensive

In factory or field, the Type S set will quickly and accurately measure resistance or locate faults. It will withstand, without detriment to its electrical qualities, the knocks which such a set is bound to get. It is of the Dial Decade Type, and therefore simple to operate. Excellent design plus quantity production enables a low price without sacrificing accuracy—ratio coils 1/20 per cent, rheostat coils 1/10 per cent guaranteed. The removable suspended coil galvanometer deflects a millimeter per microampere. This combination—accuracy of adjustment of coils, sensitivity of indicator, ruggedness, inexpensiveness—is found only in the Type S set.

PRICE \$75.00

HIGH TENSION EQUIPMENT

Economy and High Space Factor

B U S S W I T C H E S

DELTA-STAR Unit Type designs are characterized by their originality and effective use of material. In addition, their applications are so practical that engineers immediately recognize the real savings secured in adopting Unit Type for station work.

THE Unit Type bus type disconnect illustrated was specially designed to meet the requirements of a large power company. Their engineers were confronted with serious space limitations when it was found necessary to increase the plant capacity and add a number of oil switches to the feeder circuits.

OUR engineers quickly solved the problem by designing the Unit Type WC-14-disconnect. It can be clamped directly on the bus, and is built so that the blade can be set at any angle to the bus. This insures a short run to the oil switch, saving space and copper. It is a typical example of Delta-Star ingenuity.

Blades can be set at any angle to the bus

Made for use on round or flat bus bars. The real disconnect for oil switches.

JUST give the bus type disconnect a little consideration on your next oil switch installation. The possible saving in copper for making connection will surprise you. The dimensions and general data are given in Delta-Star Bulletin No. 33.

The Square D Safety Switch Makes Electricity Fool-proof

Hundreds of large Canadian industrial plants have eliminated the danger of costly, horrible accidents, due to open knife electric switches, by installing Square D Safety Switches.

The owners of these plants know that Square D Safety Switches are cheaper than accident claims, shut-downs, slowed-up production, lowered efficiency and general unrest among the employees.

Live parts of the Square D Safety Switch are completely enclosed in a compact steel box and the switch operated by a handle outside the box. Cover of box may be locked. And the switch itself can also be locked "off." Absolutely no danger of shock or burn through carelessness or ignorance.

Square D Switches are built in two, three and four pole types in Standard voltages of 125, 250, 500 A.C. and 600 volts; and in capacities from 30 to 1200 amperes. Over 300 different types and sizes—a switch for every possible requirement.

Conform to the highest standards of Canadian electrical installations and are approved by the Hydro-Electric Power Commission of Ontario. Listed as standard for both fire and accident prevention by the Underwriters Laboratories. Meet the requirements of the National Electrical Code of the Bureau of Standards.

Whether you are an electrician, engineer, contractor or dealer, the Square D Safety Switch is of vital interest to you.

Write for literature and complete information.

Krantz Panel Boards

Dispel Danger and Add Convenience

The risk of contact is entirely eliminated in the Krantz Safety Panel Boards because the live parts are contained in an inner compartment, access to which is obtained only by the electrician with the key. The switches can therefore be operated by any inexperienced person without danger.

The renewal of fuses or the replacing of a damaged switch does not disturb the wire connections as it is done from the front.

The safety, simplicity, convenience and high grade construction and finish of the Krantz Panel Board make it an essential part of modern electrical equipment.

"Three E" Cable End Bells

Three E. Cable End Bells are made for all standard voltage up to 35,000, for single and multiple conductor cables, indoor or outdoor service.

They provide a means of securely grounding the lead sheath, thus removing any static accumulation which might later puncture the insulation. They also seal the cable and make it moisture proof.

All bells are assembled from interchangeable stock parts which means prompt shipment.

HIGH QUALITY
LINE AND STATION EQUIPMENT

When the Boss Consults the Electrician

The dealer who sells Robbins & Myers Motors is in luck when his prospective customer goes out into the factory and gets first-hand motor information from the electrician.

For the man who works and lives with the power equipment knows better than anyone else just what R & M Quality means. He has accurate knowledge of the comparative performances of the different motors about the plant. And since R & M Reliability is a real asset to him in his work, the dealer can depend upon his enthusiastic support toward making the sale an R & M Motor sale.

Because of the service they give, the dealer can usually depend upon the R & M Motors he has sold helping him get repeat orders. They insure permanence and a substantial growth for his motor business.

And because R & M Motors are now and have for a decade been advertised dominantly in the leading national publications, they also make it easy for the dealer to make the initial sale to a new prospect. The R & M Motor is one motor everyone knows about—the man who has never used a motor before as well as the experienced motor buyer.

KEYSTONE Car Specialties

Operating cars at night without efficient headlights or illuminated destination signs is not economy.

Cars equipped with "Golden Glow" Headlights and Illuminated Car Signs are attractive, safe, more efficient, and above all, are appreciated by the riding public.

Your patrons, better than anyone, realize the safety value of efficient headlights.

The bright, illuminated sign is always an inducement to ride.

"Golden Glow" Headlights and Illuminated Signs are perfect in every detail. They are a part of the broad line of well-known Keystone Specialties.

Education of Public Only Solution of Electric Railway Difficulties

Considerable space in this issue is given over to papers and reports presented before the recent convention of the American Electric Railway Association in Atlantic City. This convention was of more than usual interest as it seemed to indicate, from the tone of the members' remarks, that a little sunshine is at last breaking through the dense clouds that have enveloped the electric railway business for the past five years.

Briefly stated the situation resolves itself into one of "expediency"—for the companies and the public alike. What is the best thing to do under the circumstances? It is true, of course, that the average railway is tied up by franchise agreements, but what is the use of that if it means a receivership, bankruptcy and a demoralized service? Already the matter has been too long drawn out and the industries of the whole country are suffering. Demagogues are using the situation to gain their own ends—to inflame the passions of the electors against the corporations. The education of the public has been in the wrong hands and along the wrong lines. Those who would teach have themselves failed to learn the lesson that you cannot fatten any industry permanently at the expense of another—and a base industry at that. You cannot build without tools and material. Transportation that is at the same time rapid, comfortable, safe and sanitary lands the worker at the factory fit for his day's work and delivers him again at his home in a fit mood and condition to profit by his period of recreation. A proper transportation

system thus adds tremendously to the efficiency of the worker and hence to both the quantity and quality of his production. Thus the cost of the transportation becomes a matter of very secondary importance. The case is so clear and the arguments so convincing that there can be no doubt the public could be brought to see the street railway situation in proper perspective if the politicians would let them do so. Much good has been done by the railway companies in the way of distributing enlightening propaganda but much yet remains to be done. In the meantime it is encouraging to hear the note of optimism running through the various discussions at the recent convention. The public thinks, votes and acts according to the facts at its disposal. Where they are properly informed the public can be depended upon to take the right course. It only remains then to inform them and the onus falls on the railway companies. Rightly or wrongly this is so, for they are the only ones who understand the situation and can state the facts. The education of the public must be pushed forward, therefore, by every possible means as the only solution of the difficulty that threatens to engulf, not only the railways themselves, but the general industries of the Dominion which are very directly dependent upon them.

Says Private Ownership Superiority Demonstrated in World War

E. N. Hurley, who served throughout the war as chairman of the United States Shipping Board, was asked if he would tell what in his job had impressed him most.

"The efficiency of private ownership and operation as compared with public ownership and operation," was the answer, "and I believe this lesson, as it is brought home more emphatically to the American people, is to prove one of the greatest benefits we derived from the war.

"As new facts about the conduct of the war come out, as our experience in many fields of production is appraised, they will point, I predict, more unerringly to this same conclusion—the superior efficiency of private ownership. All production centers on the cost—you can't get away from that. Shift responsibility for the cost, for the best possible result under a given set of circumstances, and you shift the responsibility for efficiency. That is what we did on the Shipping Board, under the pressure of war's necessity, when the question of cost was forced into second place. We shifted this responsibility from private shipbuilding concerns to the Government.

"With the shifting of responsibility of cost to the Government, that keen interest in results which follows private initiative was gone. There you have the whole problem as between public ownership and private ownership stated. No way has been found to instill in public ownership the incentive that possesses private ownership to improve conditions of production.

"The cost-plus-percentage system was a great mistake, and from the start had a bad effect on the workmen and the management. No private concerns could have operated and paid their way on the wages paid under that system. On the basis of cost they could not have borrowed money from the banks. The whole proposition of government ownership is fine in theory; in practice the push of individual energy is missing.

"I don't know of a government-owned plant that produces more than two-thirds efficiency. When the manager has no dividend to strive for when the toll is paid, the slowing up is sure to follow. In the years to come some way may be found to keep incentive to best endeavor in men under government ownership, but until that is discovered that system may be classed as a failure."

Nitrogen Fixation Possibilities Explained at Vancouver Electric Club Luncheon

Utilization of electrical energy in Western Canada for the greater development of that country, was touched upon in an interesting manner by Mr. I. Freeman, formerly chemist of the American Cyanide works at Niagara Falls, in an address he delivered last month at the weekly luncheon of the Vancouver Electrical Club. The attendance was the largest since the club was inaugurated, and the speaker revealed some matters that had not been brought to light since the start of the great war. Mr. Freeman traced the history of the separation of metals by means of electrical energy, from 1807, when Sir Humphrey Davies made the interesting discovery of the separation of metallic sodium, and explained why the delay occurred in the development and carrying on of this process, which, he said, was the non-development of electrical machinery to produce power and transform and transport it.

In 1880 the Niagara Falls first showed any development of electrical power from water, and immediately a separation process sprang into existence. That process was exactly the same as Sir Humphrey Davies had used eighty years before, and it is the one that is in use to-day. That process came from England to Niagara because there was cheap power developed from water which was so necessary in the nitrogen industry. In Canada, said Mr. Freeman, we have the only nitrogen commercial fixation plant in the British Empire. In 1900 the Germans sought to produce a process of fixation. Possibly at that time they thought there would be a great war and that they would be cut off from Chili, which was the source of all nitrates, and this was the case.

In 1900 a group of capitalists in Tennessee became interested in one of the rivers in that state, and arrangements were made for its development. An eminent engineer was sent to Europe to investigate the different processes of nitrogen fixation, and he made his report that the process known as cyanamide was the most suitable for American conditions. The arc process was working successfully in Norway and producing nitric acid, but it required very cheap power to do so.

It was then found there was an obstacle in the way of developing power on the Tennessee river and that the one place in the world where cheap energy could be secured was at Niagara Falls, and, as a result, the plant was put in Canada, and the company started operations in 1907. That plant to-day fixes about 12,000 tons of atmospheric nitrogen per annum. The details of the process are more or less confidential, but he could, said Mr. Freeman, give some of them.

The raw materials are carbon, coke, limestone and the atmosphere itself. The coke is carefully dried before being used in the furnaces and the lime is used fresh from the limekilns. These two ingredients are mixed in equal proportions about the size of a chestnut and fed into the electric furnaces. These furnaces are nothing more than rectangular tanks lined with ordinary brick and a carbon bottom. In the bottom is coke, rammed up with pitch. The electric current is applied by means of electrodes which are huge blocks of carbon. The current melts the lime and the coke reduces the lime, takes the oxygen from it and leaves the calcium metal. The calcium combines with the coke and calcium carbide is formed. The temperature is between 2,000 and 3,000 centigrade and, owing to the presence of a small amount of lime in the carbide, the carbide flows very easily.

It is on the ends of the electrodes that the carbide is formed. The carbide can be poured out of the furnace. That operation is on a large scale to-day, and there are furnaces built at Niagara Falls which are taking 12,000 kw.

hours each. There were three furnaces built recently of 4,000 kw. capacity each. Two of these furnaces will do the work of nine furnaces which were in operation during the war. The larger the furnace the greater the efficiency.

Mr. Freeman described the process of taking the calcium carbide from the furnace and the distillation of the nitrogen which came out 99.9 per cent. pure. The ground carbide is put into drums four feet in diameter and 8 feet deep. The was was brought in contact with the carbide powder. A carbon pencil is placed in the centre of the cylinder so that it forms the axis of the cylinder and the electric current turned into the pencil. This pencil becomes very hot and the nitrogen combines with the carbide next to the pencil and the result is a reaction takes place which gives off an immense quantity of heat, so that the carbide is also brought to a white heat. That heat is sent on to the next layer of carbide towards the periphery. After a time the current is shut off and the whole mass of carbide is converted to cyanamide.

That contains 20 per cent of its weight in nitrogen. This process, Mr. Freeman explained, of fixing nitrogen by means of carbide, was invented by two Germans, who were after something else, and who came upon it accidentally. During the war Germany produced 600,000 tons of cyanamide. They had it within their boundaries for the production of explosives and, furthermore, they had the means at hand to produce fertilisers for their fields.

Cyanamide was made available long before the war ended and is now available at a price lower than the Germans ever charged.

Mr. Freeman went on to show the derivatives of cyanide, and said that he looked to see the cyanamide process developed in Canada at no distant date to supply fertilisers to the prairies, in a highly concentrated form. He referred to the immense water power in British Columbia and expressed the opinion that there was no reason why that power could not be utilised for the development of electrical energy to supply this fertiliser that was so much required in the middle west to-day. It would be seen from this that the possibilities of electrical energy were amazing.

In reply to questions Mr. Freeman stated that the horsepower at Niagara Falls to-day, which was being used by the American company, was 30,000. He thought carbide could be made in this country if the power were cheaper.

Mr. J. R. Read of the Canadian Westinghouse Manufacturing Company presided and several new members were introduced at the luncheon.

Hamilton Rotarians Visit Power Plant

One hundred and thirty-four members and guests of the Hamilton Rotary Club visited the East End steam power station of the Dominion Power & Transmission Company, Limited, Hamilton, on Thursday, October 16th. The company placed at the disposal of the Rotarians two special Interurban cars which were run over the Radial and the company's private switch to the door of the steam plant. After a thorough and systematic inspection of the plant, following the steam and water routes, the visitors were served with dinner in the turbine room extension. Mr. A. T. Enlow, president of the Rotary Club, presided at the dinner. Mr. W. G. Angus, superintendent of light and power for the company, and who was responsible for the arranging of the outing, gave a short address which was enthusiastically received in true Rotarian style. The trip was an eye opener to those who were fortunate enough to take advantage of it and all were impressed by the orderliness, the extent and completeness of the plant, which, although comparatively quiet, gives one the impression of immense capacity and power.

On the occasion of his recent visit to Niagara Falls, Ont., the Prince of Wales gave the magic touch which produced this wonderful effect

Flood Lighting of the Horseshoe Falls

The flood lighting of show places is rapidly gaining ground as a means of extending their attractiveness beyond the hours of daylight and thereby increasing their interest for tourists and residents. The lighting of the Horseshoe Falls at Niagara, where there has recently been installed a flood lighting battery of some ninety-odd 1000-watt lamps on the Canadian side of the river, is an example possessing some interesting features peculiar to itself. The installation was operated for the first time on the occasion of the recent visit of the Prince of Wales to Niagara Falls, the Prince himself officiating at the inaugural ceremonies.

An inspection of the possible locations for the battery resulted in the selection of the corner of the roof of the Ontario Power Company's generating station for the main group of projectors. From this point light can be thrown upon all parts of the falls without the apparatus intruding itself upon the gaze of sightseers during the daytime. Another feature worthy of consideration is that directly beneath the roof is an adequate supply of power. At times, however, the rising cloud of spray conceals the view of the crest of the Falls near the apex of the horseshoe from this location and to offset this a group of ten short-focus projectors was installed on the roof of Table Rock House (see map). By reference to the map it will be seen that the distances are considerably greater than are usually encountered in ordinary flood lighting. The height of the falls is 158 feet and at the longer distances the diameter of the beams is greater than is necessary to cover the face of the falls. In these cases the tops of the beams are trained upon the crest. The diffused light from the main projectors was counted upon to illuminate the water at the foot of the falls.

Long-focus projectors, utilizing the regular type gas-filled lamp, were selected for the main group because such lamps are more readily secured and because of the fact that

high beam concentration is unnecessary. Large areas, both vertical and horizontal, are to be lighted and as all the light below the rim of the falls is utilized in lighting desirable surfaces; there is very little wasted.

Plan of illumination installation

The main battery placed on the roof the O. P. Co's. plant consists of 81 projectors, each containing one 1000 watt lamp. The battery is divided into 9 banks of 9 units each. Each bank is a complete three-phase unit in itself being equipped

General view of Horseshoe Falls, illuminated. Flood lights seen in right of picture

View, from above, of batteries of projectors grouped on the roof of the O. P. generating station

with a service box containing fuses and switch. All service boxes are enclosed in tight fitting wooden housings as an additional protection against spray. The connections from the sub-feeders to the projector sockets are through flexible conduit securely fastened at each end so that any accumulation of ice will not impose a strain on the wires. Three 30 kw. transformers are located close to the projectors and are connected to the 2200 volt busses in the power house by lead covered cable in conduit. Weatherproof cable is used for low tension feeders.

The effects secured by this installation are dependent to some extent on the spray conditions. At times during the day different parts of the falls are obscured by spray, depending on the direction of the wind. The same conditions of wind and spray are likely to be found at night and no attempt was made to penetrate the spray with artificial light. If such light could be projected through the spray the latter would still obstruct the vision as in daytime—more so in fact. The Table Rock group was therefore installed to light up the crest of the falls as there is a fine view from this point. In the final adjustment of the beams it was found that more of the contour of the falls toward Goat Island could be illuminated than is shown on Fig. 1 and each zone was spread out slightly to accomplish this purpose.

In the final result some unexpected effects were obtained. When approaching the edge of the gorge the illuminated water forming the sides of the basin, viewed against the dark surroundings, gives the impression of a huge, seething cauldron, the ascending spray helping out the effect. Considerable light is reflected from the spray onto the roadway, producing appreciable increase in its illumination. The cloud of spray ascending into the sky radiates a bright glow that can be seen for some distance.

This installation was designed and erected by the Hydro Commission's engineers. The reflectors are X-ray type supplied by Mr. George J. Beattie.

National Electric Light Association Offers Home Study Courses

This is an age of specialization and the demand for specially trained men greatly exceeds the supply. The obvious reason for this is that in the large organizations now engaged in the different branches of the electrical industry in this country the work is necessarily complex, and in order to overcome this complexity and evolve co-ordination out of seeming chaos the work is divided, one set of men doing one

thing, another set of men doing another thing, and so on. It is evident, then, that the man with special training in some one thing is the man most sought after.

In the central station industry the National Electric Light Association is answering the question by providing the central station employee with this training, and by so doing, benefiting both the man and the industry. This training is obtained by use of home study courses prepared by specialists and distributed by the National Electric Light Association. An explanation of each follows:

Course in Practical Electricity

This is a course of ten lessons prepared for practical men who are engaged in the central station business, and it covers a selection of subjects which will give the best knowledge of the necessary fundamental principles. The lessons are written without the use of advanced mathematics, and are easily understood by the non-technical man.

Commercial Engineering Course

This course of seventeen lessons is prepared particularly for men who want to learn the commercial side of the business, and it thoroughly and completely covers the selling end of the industry in all its branches. It is practically the only method in print of teaching new employees the business of the central station.

Elementary Accounting Course

This is a mercantile course of seven lessons, covering fully the fundamental principles of bookkeeping and accounting. It is thoroughly equipped with questions and exercises and with all necessary account books, forms, and other material for a thorough elementary course. It has been especially adapted as a preparatory course for the Advanced Course in Electric Utility Accounting.

Advanced Course in Electric Utility Accounting

A highly specialized course in Electric Utility Accounting of 36 lessons, covering all phases and the best modern practices of our most progressive companies. It follows the Association's Classification of Accounts of Public Service Commission requirements, and carries the students from the organization of the company through to the operation of a holding company. Complete with necessary book and special material.

Special booklets on any of the above courses will be sent upon application to Mr. Fred R. Jenkins, 72 West Adams Street, Chicago, Illinois.

Electric Railway Officials are Encouraged

In the Recent Atlantic City Convention of the A.E.R.A. Various Speakers were Optimistic that the Public are Showing a Better Appreciation of the Situation—Extracts from Papers and Reports

One-Man Car Operation in Increasing Favor With Both Public and Officials*

Your committee feels, after its study of the subject, that the topic assigned to it represents the most important improvement in street railway operation that has been brought out in the last decade.

Our investigation indicates that the subject of one-man car operation naturally divides itself into two fundamentally different cases:

1. The mere rearrangement of existing two-man cars so that they can be operated by one man, thus saving platform expense, and, if equipped with safety devices, making an improvement in accident cost.

2. The creation of an entirely new type of car of low weight, greatly improved safety, and more rapid acceleration and deceleration. This car of the light-weight safety type not only saves platform and accident expense, but permits an improvement in service, such as well nigh to revolutionize the street railway business.

The operation of street cars by one trainman in small communities where small gross per car-mile demanded the utmost economy in operating expenses, is not a new idea in the street railway business, the practice having been followed for years by many of the smaller companies; but the modern light safety car represents a radical improvement in the whole art of urban transportation and, therefore, will be the principal topic discussed in our report.

The jitney was what produced the light safety car. The popularity of the jitney proved beyond a possibility of doubt that frequent, quick service would get passenger business away from the slow and infrequent street car, and it was up to the street railway industry to develop light cars that would simulate jitney service. Following this idea, Charles O. Birney designed the car that now bears his name. It was realized that the car must be light in order to accelerate quickly and that it must be operated by one man in order to compete with the jitney which was similarly manned. The safety devices followed from the realization that the public would not patronize the car unless it was convinced that it took no more chances in doing so than with the two-man car.

The new car, weighing only 13,000 lbs. and seating thirty-two people, had to be designed from the bottom up—wheels, axles, truck, body and motors were all radical departures from previous practice and the automatic safety features alone were a triumph of adaptation to the compelling forces which led to the development of the new car. In general, these safety devices consisted of ways to make the operation safe in case the operator dropped dead, or slackened in attention. The "dead-man's handle" required that the operator have his hand constantly on the controller or it would throw off the power. Similarly, if the power were so thrown off, the brakes would be automatically applied and sand fed to the track, and, when the car came to a stop, the doors, previously held securely closed by air pressure, are made available for manual operation to form emergency exits if desired.

The committee desires to emphasize the importance of

the safety devices in one-man operation. We are advised that practically all of the cases of unfavorable action by the public or public bodies against one-man car operation have been where no safety devices were installed on the cars.

In order to support our own opinions with the largest possible reinforcement of opinions of those engaged in the business, questionnaires were sent out to all member companies. These questionnaires were prepared after a full committee meeting and cover all phases of the subject. The companies replying numbered ninety-three, representing 1,123 one-man cars. It was found, in general, that more than half of the companies reporting were 100 per cent. one-man operated, and that 41 per cent. of all cars of the reporting companies were one-man operated.

The total number of light safety cars in operation in the United States at the present time, allowing for deliveries which will be made up to the time this report is presented, is 1,100. The number under order and in process of manufacture is 600—among the latter an order for 200 for the Brooklyn Rapid Transit Company. The total number of one-man cars, including safety cars, in use in the United States is somewhat more than 2,000.

Replies to Questionnaires

Power Consumption.—Companies using the safety car report an average reduction in energy consumption per car-mile of 51.2 per cent. Taking 3 kw.-hr. per car-mile as a fair average for most city systems, this means a saving of about 1.5 kw.-hr. per car-mile. Actual figures from forty-five companies show energy consumption of safety cars ranging from 0.8 to 1.75 kw.-hr. per car-mile as a fair average for most city systems, and this means a saving of about 1.5 kw.-hr. per car-mile.

Trainmen.—Replies showed that the operator of a one-man car was paid more than either trainman in two-man car operation by 62.5 per cent. of the companies answering the question, the range being as follows:

Number of companies	Cents per hour additional
1	1
10	2
5	3
13	4
1	4½
10	5
1	7
1	7
1	8
1	7½
1	4
Average	4

As to the feeling of the trainmen toward one-man cars the replies showed:

Favorable	83
Unfavorable	10
Per cent. favorable	89.2

The same ratio was reported as to opposition by trainmen to the inauguration of one-man car operation, the opposition being classified as seven, due to labor union feeling, and three due to apprehensions of the men as to the difficulty of accounting. Only two companies out of forty-five report the trainmen disliking the safety cars.

In answer to the question as to whether or not trainmen had been assured they would not lose their jobs due to the starting of one-man operation, thirty-nine companies reported that they had made this promise, forty-two that they had not.

The Public.—The attitude of the public toward one-man

*Abstract of Report of A.E.R.A. Safety Car Committee.

cars when started was reported as friendly by eighty-four and unfriendly by fifteen. This latter number was changed to four after a trial of the cars themselves, thus resulting in a final public verdict of 96 per cent. in favor of the one-man cars.

The action reported by public bodies toward one-man cars was as follows:

Cases of favorable action by city commissions	10
Cases of favorable action by state utility commissions	11
Instances of defeat of proposed unfavorable state laws	3
Refusal of city council to pass prohibitory bill introduced by labor	1

Only two unfavorable acts by public bodies were reported, one by a district court and one by a city commission, but in these cases, the safety car was not at issue.

Regarding the question of fare collection with one-man cars replies showed no difficulty or not any change from conditions with two men in eighty-eight cases, and the three companies reporting difficulty said it was only to a limited degree.

Schedules.—The replies to the questions under this heading had to be clearly distinguished as between light-weight safety cars and converted one-man cars, because the latter could not, of course, expect to effect any change from their former schedule.

Regarding headway, the average increase in number of cars operated on lines using safety cars was 43.7 per cent.

Similarly, with schedule speed this was increased an average of 14.76 per cent. with the safety cars, thus making an average increase in car frequency of 58.46 per cent.

As to lay-over time, more was found needed by twelve companies, but no additional needed by seventy-five companies.

As indicating the wide range of adaptability of safety cars, headways from one minute to thirty minutes were reported.

Earnings.—The wonderful success of the safety car in building up traffic was indicated by the answers to these questions. Of course, with converted former two-man cars, no effect in increased earnings was observable. The average for the six companies using safety cars which were the most successful shows the following:

Gross per car-mile before one-man car operation, cents	21.11
Gross per car-mile after one-man car operation, cents	20.65
Decrease in car-mile gross, per cent.	2.3
Increase in car-miles operated, per cent.	53.4
Increase in total gross earnings, per cent.	51.1

In one city of 125,000 population, an increase of 79 per cent. in car mileage on lines where the safety cars were operated produced an increase of 71.2 per cent. in total gross earnings from the lines in question.

The replies as to the effect of light safety cars in eliminating jitney competition do not make a very impressive showing statistically, partly however, because in a large proportion of the companies reporting no such competition existed, but nine companies report complete and two companies partial elimination of this competition through the use of safety cars.

Operating Features.—Various degrees of accident reduction were reported by forty-seven companies and no such effect noticed by twenty-two. It is significant to observe in this connection, that the number of companies operating one-man cars without any safety devices is twenty-four.

On car maintenance, the replies were necessarily inconclusive, due to the comparatively brief time the safety cars have been in operation, but six companies report a reduction of 50 per cent. in car-mile maintenance cost with safety cars and others predict various savings in the future. Naturally no saving in car maintenance can be secured where the former two-man car was simply rearranged for one-man operation.

A saving in the cost of track maintenance was predicted by fifty-two companies. Two large systems advise that they

propose a reduction of 20 per cent. to 30 per cent. in rail weight if safety cars are standardized on in the future.

The acceleration of safety cars in miles per hour per second as compared to the average car on the system showed:

Average car	1.67
Safety car	2.53

Regarding flagging railroad crossings, the consensus of opinion appears to be that greater safety is obtained where the responsibility rests on one operator than where, as is the usual practice, it is in effect divided between two trainmen, with the proviso, however, that where the view from the car is obstructed, a flagman is desirable.

Distribution.—That the application of safety cars is not to be restricted to unimportant operation—light traffic lines, etc.—is shown by the following table indicating the use of such cars based upon the population of respective cities.

	One-Man Cars	Safety Cars
25,000	272	27
25,000 to 75,000	422	178
75,000 to 150,000	367	167
Over 150,000	96	59

Conclusions.—The answers to the general question of whether the experience with one-man car operation would lead the company to favor the extension of its use, show the following striking results:

Extension favored by	76
Extension not favored by	2

What Safety Cars Can Show

In order to indicate clearly the effect to be expected from the results already actually obtained by street railway companies, from the use of safety cars, the following typical example has been worked out.

Present Conditions	
Length of route, miles	4
Average speed, miles per hour	8
Cars operated	6
Headway, minutes	10
Gross per car-mile (5-cent fare), cents	25
Conditions with Safety Cars	
Average speed, miles per hour	9
Cars operated	9
Headway, minutes	6
Increase in car-miles, per cent.	66½
Gross per car-mile, cents	24
The safety cars can be purchased on the basis of 20 per cent. cash and the balance in equal monthly instalments with interest at 7 per cent. on deferred payments covering a period of five years. The average annual charge then becomes:	
One-fifth of purchase price of \$6,000	\$1,200
Interest (average per year)	170
Average per year for five years	\$1,370
The showing then becomes as follows:	
Earnings:	
Present 315,210 car-miles per year at 25 cents	\$ 78,802.50
Future 525,350 car-miles per year at 24 cents	126,084.00
Increase in gross earnings	47,281.50
Expenses affected by changes:	
Annual cost of cars—nine at \$1,370	\$12,330
Power:	
Present: 315,210 x 3 = 945,630 kw.-hr.	
Future: 525,350 x 1.5 = 788,025 kw.-hr.	
Saving: 157,605 kw.-hr.	
At 0.8 cent for fuel = \$1,260.84.	
Trainmen's wages:	
Present: Twelve — eighteen hour men at 45 cents	\$97.20
Future: Nine — eighteen hour men at 50 cents	81.00
Daily saving	\$16.20
Per year, 365 x \$16.20 = \$5,913	
Accidents:	
Present: 5 per cent. of \$78,792.50	\$3,939.63
Future: 2½ per cent. of \$126,084.00	3,152.10
Saving	\$787.53
Car maintenance:	
Present: 3 cents x 315,210 car-miles	\$ 9,456.30
Future: 2.1 x 525,350 car-miles	11,032.35
Increase	\$1,576.05
Total increase in operating expenses	\$5,944.68
Results	
Increase in annual net earnings from the use of safety cars on the line, \$11,336.82.	

This result is secured:

1. While paying out of operating expense the investment in new cars to do the work.
2. While giving the patrons of the line 66-2/3 per cent. increased car frequency and 12½ per cent. increased speed.
3. Without any allowance for the savings in track maintenance from operating a 13,000-lb. car as against a 35,000-lb. car.
4. While increasing the net earnings per mile of track per year for

the line (estimated as double tracked) by \$4,580 or 6 per cent. on a track valuation of \$76,500 per mile of single track.

Conclusions and Recommendations

1. The safety car is one of the most important improvements in street railway service that has appeared for many years. Its valuable features in the order of their importance are:

(a) Greatly improved service to the public, both as to frequency and safety.

(b) Increased earnings for the company.

(c) Decreased operating expenses.

2. One-man operation alone, while useful in saving platform expense in the smaller communities is not comparable with the improved service that can be obtained with the light-weight safety car with its more frequent headway and greater average speed.

3. The savings obtainable from one-man cars should be shared with the trainmen in the form of higher hourly rate for the operators of such cars than is paid to the trainmen on two-man cars.

4. When inaugurating one-man car service, it is good policy to assure the trainmen that no one will lose his job due to putting in the new cars. They are installed, as a rule, a line at a time, and experience has proved that the company is not burdened with extra men through this policy.

5. From the nature of the traffic available, the safety cars can accomplish more in a large city than in a small one, for the reason that the possibilities of increasing riding

in the small community are limited. This statement is made to correct the erroneous impression existing in some minds that the safety car is useful only for saving expense in the smaller cities.

6. Where traffic is believed to be too heavy on peak to be successfully handled by safety cars, the larger, heavy cars may be used for tripper service on peak, thus making the light cars handle the long hour runs.

7. Similarly, where snow storms require the use of the heavier equipment at rare intervals, the safety cars can still be used to advantage during other times.

8. The safety car, though light, is just as substantial and with the same care in maintenance should last just as long as the former types of car. It has a steel frame and thoroughly modern, ventilated, interpole motors.

9. Regarding the matter of standardization, your committee was not unanimous, but the majority opinion favored adhering to the present standard design of the safety car in the interest of cheaper costs through quantity production.

10. Experience has shown that the overwhelming majority of both riding public and trainmen favor the one-man safety car; that it can, at one and the same time, improve the public's service, increase the trainmen's wages and raise the company's profits; that it can be purchased without financing and operated for about half the cost of an ordinary car; and that most of the companies that have tried it want more. We predict an increasing rapid extension of the use of a device that can make a showing like the above.

Relationship of Items of Cost Under Pre-War Conditions and To-day

By Mr. F. W. Doolittle*

The fact of high prices is one that does not need to be dwelt upon for emphasis to-day. With exceptions so few as to be negligible, prices to-day are so much higher than those existing in 1914 that all industry has found it necessary to rearrange the budget of revenues and expenditures in order to continue in existence. Probably no single fact of recent history has been discussed so fully, and with all so ineffectually, as the high cost of living. These high costs are both a cause and an effect. High prices for food and clothing, for rents and service, bring about increased wages, and these increased wages in turn make the cost of food and clothing and all other commodities into which wages enter, higher than before.

The electric railway industry has been before the public with a schedule of increased costs of labor and materials, continuously during the past three years, and in many instances, the revenue of the companies has been increased substantially because those in authority have realized that the increased costs must be met if service was to be continued. That continuity of service is the persuasive reason for granting relief, appears to be a fair conclusion, because public authorities have generally permitted such increase in revenues as would tend to provide the companies with funds to meet increased wages, increased cost of power and increased cost of materials and have stopped there. Very little consideration has been given the increased cost of money, for the money which is already invested must stay in the industry, and the new money necessary to permit the industry to expand and serve prosperous and growing communities is a requirement relatively remote in the minds of public regulators. Consequently, relief has not

been granted to the extent that the company might compete in the open market for funds with which to extend its service to meet the expanding needs of the communities they serve.

It may be urged that it is idle in view of the general consciousness of high price levels to discuss their cause, yet the persistence of high costs is a matter of great importance. It has been said, and not infrequently, that existing high costs are temporary and that the industry should bear the burden during the few years when these costs will obtain. It would be a rash individual indeed, who would publicly announce his convictions that costs would never be lower, yet it is the opinion of many who have given this matter careful thought that the present high prices are likely to remain for many years, because the process of fattening the anemic dollar is one which cannot be hastened and which is beset with difficulties, the full extent of which is realized. If the present high costs are but a matter of a few months, the problem of maintaining the solvency of the industry is far different than it must be if lower prices are to be experienced only after a considerable period of years.

Increase in costs, while much accelerated of late, have been in process before the war, as pointed out in the studies on cost of service made for the Bureau of Fare Research of the association in 1914. Since 1914 material prices have approximately doubled. The average wages which sustained the noteworthy increase of from \$627 to \$711 from 1902 to 1912, reached \$906 according to the 1917 census figures, climbed over \$1,100 since, and the ultimate aim of labor, as disclosed by the testimony before the Federal Electric Railways Commission, contemplated a minimum

*Milwaukee Electric Railway & Light Company.

standard of \$2,000, based on present conditions of cost of living.

From a review of the historical facts as to gold production, commodity production, changes in currency, and particularly as to the effect of wars upon prices, the conclusion is indicated that the future trend of prices will continue upon the present high level for some time. This conclusion is inevitable whether the reasoning is based upon the quantity theory of money or whether it proceeds upon other ground. The minimum period assigned during which prices will continue abnormal varies from five to ten years. This general conclusion as to future price trends must be recognized in regulating the future service rates of public service companies. Wage rates and the cost of materials will continue on a high level. This will affect the current expenditures for operation and for reconstruction, while extensions and additions to fixed plant, deferred on account of the war, must be financed on the basis of high prices.

To supply adequate credit for these future operations and at the same time to preserve the public confidence in the security of past investments, regulatory authorities must recognize the higher level of prices. Security of investment and a commensurately increased rate of return should be the fixed points toward which rate regulations must aim if the development of public service enterprises is to be placed and kept on a parity with that of other industrial undertakings.

Comparison of Costs on Hypothetical Railway

The preceding rather general discussion may well be supplemented by figures indicating in a general way the magnitude of the problem of those who are charged with the duty of continuing to render street railway service under the conditions of private operation regulated by government authority. The method to be followed will be a comparison of present-day costs of operation with those existing in 1914, through the method of applying 1919 prices to the quantities both of labor and materials purchased in 1914. There has, therefore, been assumed a hypothetical property which in 1914 carried 100,000,000 passengers for a revenue of \$5,000,000. This company had 185 miles of line, practically all of it double tracked, and 625 cars, including the reserve equipment necessary to permit periodic shopping. These cars made during the year 1914, 17,500,000 miles in a little less than 1,900,000 hours, or at an average speed of a little less than 9½ m.p.h. The operating expenses of this company in 1914, including \$500,000, or 2 per cent. on the cost of its property set aside for depreciation, amounted to \$3,750,000, and there was available for return on investment in the property \$1,250,000, or 5 per cent. on a total cost of property of \$25,000,000.

An analysis was made of the 1914 operating expenses of this hypothetical company, and each class of labor and kind of material has been separated and classified. The resulting comparative condensed income account is shown in Table I.

Table I.—Condensed Income Account—Standard Classification

	1914	1919
Operating revenue	\$5,000,000	\$5,000,000
Operating expenses (including replacement insurance)*	3,750,000	6,163,000
Maintenance of way and structures	\$375,000	\$875,900
Maintenance of equipment	575,000	970,300
Power	615,000	1,149,000
Conducting transportation	1,225,000	2,225,000
General and miscellaneous	355,000	492,800
Taxes	375,000	450,000
Net operating revenues	\$1,250,000	\$1,163,000†
*Maintenance of way and structures		\$320,000
Maintenance of equipment		110,000
Power		70,000
†Deficit		

Each type of labor and each of the principal items of

material was increased in the percentage that prices current in the latter part of this year bear to prices which were current during 1914. Use has been made of index numbers, of the records of several of the larger companies, and particularly of information compiled by this association, to determine a fair average increase by types of labor and types of material during the past five years. The operating expenses, which were \$3,750,000 for this hypothetical company, in 1914, would amount to-day to \$6,163,000, or an increase of 64 per cent. This increase has been far from uniform, being least in general and overhead expenditures and highest in those expenditures which involve the maintenance of track and buildings, particularly the former. This is undoubtedly accounted for by the large increase in the cost of lumber products and manufactured metals with the fact that common labor has generally shown a higher percentage of increase than that which has been gained by the skilled and semi-skilled classes. Through organization, skilled labor has been able to effect an artificial scarcity, and early gained wage increase by this method. To-day

Table II.—Condensed Income Account—Functional Classification

	1914	1919
Operating revenue	\$5,000,000	\$5,000,000
Operating expenses (including replacement insurance)*	3,750,000	6,163,000
Costs varying with car-hour	\$1,125,750	\$2,049,050
Costs varying with car-mile	876,950	1,482,720
Costs varying with mile of single track	150,000	312,620
Cost varying with number of passengers	332,800	486,490
Costs of electrical energy (car mile)	472,500	930,100
Administrative and overhead expense burden	417,000	452,020
Taxes	375,000	450,000
Net operating revenues	\$1,250,000	\$1,163,000†
*Cost varying with car-mile		\$210,000
Administration and overhead expense burden		290,000
†Deficit		

there is a shortage of unskilled labor far more acute than any artificial shortage of skilled labor which has been produced in the past.

This hypothetical company, then, which had \$1,250,000 available for return on investment, in 1914, would, under present conditions, find itself failing to meet operating expenses by \$1,163,000. This would, of course, quickly result in insolvency, and many companies have already reached that stage. That some have not is accounted for by increased earnings without proportionately increased costs and by certain lessening of expenditure, some of which are due to increased efficiency, but many of which can in no wise be termed economy. In such cases maintenance programs have been cut and depreciation reserves are being omitted for the purpose of meeting current operating deficits.

Following the practices outlined in "Costs of Urban Transportation Service," the detailed operating expenses have been separated into those varying with the different statistical units and the results disclosed in Table II. This separation is that now customarily employed in the analysis of electric railway operation.

The derived unit costs of operation may then be directly compared as shown in Table III.

Effect of Increased Business

It is of interest to carry the calculations a little farther in an effort to see what effect a possible increase in business and betterment of traffic conditions have on the deficit in net operating revenue. Let us assume first an increase of 20 per cent. in the volume of business during five years, and then make the further assumption that this 20 per cent. increase in traffic can be carried without departing from prior standards of loading by means of an increase of 10 per cent. in the car-miles operated. By intensive study and constant watchfulness on the part of the transportation

Table III.—Costs Per Unit

Operating expenses (including replacement insurance)			
	1914		1919
Costs varying with car-hour	\$0.60	•	\$1.09
Costs varying with car-mile	.05		.085
Costs varying with mile of single track	400.00		835.00
Costs varying with number of passengers	.33		.49
Costs of electrical energy (car-mile)	.027		.053
Administrative and overhead expense			
burden	per cent. 26.8		17.1
Taxes			

department, the average speed has been increased to 10½ m. p. h., and the number of car-hours operated is therefore the same as in 1914. Under conditions above described 20 per cent. more passengers would produce on the 1914 rates of fare \$1,000,000 in revenue and occasion operating expenses of a little less than \$400,000, so that the deficit from operation is reduced from \$1,163,000 to \$560,000. Assuming further that the amount available for return on investment is held at the amount earned in 1914, the company must have \$1,685,000 additional revenue or unit revenues of a little less than 7 cents per passenger. Nor will such revenue as this be long sufficient if the community is growing and has need for additional investment in its transportation facilities. A reasonable return on the investment, which in the light of present financial conditions must be placed at not less than 8 per cent., necessitates the addition of another ¾ cent on the fare of each revenue passenger. These computations take no account of the very serious matter of decreased riding following upon increased fares, but it is evident that if there is any serious reduction in volume of traffic the fare must approach 10 cents per passenger, which is about the figure one would expect would result from the approximate doubling in price of most of the articles entering into the rendering of service and the failure of the industry to earn a reasonable return in 1914.

Movement Charges Increased More Rapidly Than Terminal Charges

The preceding discussion has concerned itself with flat rates of fares. When an analysis is made with terminal and movement expenses, such as is necessary in determining the costs of operation under a zone system of fares, it is noted that movement costs have increased at a far greater rate than terminal costs. The detailed analysis indicates that with terminal or fixed expenses increasing 12 per cent., because of increased costs of operation, movement expenses have increased 82 per cent. This is due to the fact that movement expenses consist principally of those varying with the car hour, comprising platform labor. Assuming an average length of ride of 2 miles, 2¼ cents represented in 1914 those costs which would be independent of the length of ride, while passenger-miles costs would be 1½ cents. On the basis of 1919 costs with no increased traffic the terminal costs would be increased to 2½ cents per passenger-mile, while movement costs would be increased a full cent per mile traveled. This indicates that the increases in platform costs are increasing the discrimination between long and short-haul riders which existed under 1914 conditions. Increases in the labor item are making long-haul traffic increasingly unremunerative. The conclusions which have been reached in previous studies, therefore, as to the paying haul for a single fare and the analysis of the cost components underlying the zone system of fares must be greatly modified because of the effect of increased wages.

Reference should also be made as to the influence of the increased costs noted upon the computations previously made of the cost of complying with standards of service. In the studies previously made under this title for the association, it was pointed out that with a typical distribution of costs, an increase of 10 per cent in the car-hours furnished during the period from 6 to 8 a.m., and from

5 to 7 p.m., platform labor would be increased 3.88 per cent; carhouse handlings 13.27 per cent., while power plant and car investment would be increased 10 per cent. Because of the large element of stand-by charge in the cost of furnishing service during rush hours there is not a corresponding increase in the labor component, as there would be if labor were under all conditions provided at a fixed rate per car-hour. It is necessary to consider, however, the very important influence of the minimum wage and the requirements of time and one-half for overtime in computing the costs of such added rush-hour service.

Conclusions Stated

1. The tendencies towards higher cost of operation noted in studies made prior to 1914 have developed into revolutionary changes in price levels.
2. It is believed that these changes are permanent rather than transitory or temporary in character, and affect all components of the cost of service, including return upon the investment.
3. The analysis of cost of service made for a typical property indicates that the increases in fundamental costs incurred can only be partially offset under the most favorable and economical conditions of handling traffic.
4. Because of the large influence of the cost of platform labor, the new level of costs result in far greater increases in those costs which vary with the miles traveled per passenger than in those costs which are fixed in their nature irrespective of the length of haul. This indicates that the discrimination which has always existed between long-haul and short-haul passengers is constantly becoming greater and that our previous ideas of the cost components in a zone system of fares must be modified.
5. The increased cost occasioned in complying with higher standards of service during rush hours is vitally affected by the recent additions to costs of labor arising out of the application of the minimum wage and the provision of higher unit pay for overtime work.

Seven Cent Fare for Montreal Tramways

The Quebec Public Utilities Commission have retained the 7c straight fare recently decided on by the Montreal Tramways Commission, but have modified other parts of the schedule issued by the Commission. Instead of 4 tickets for 25c the Utilities Commission have ordered 5 for 30c, and 44 for \$2.50. The workmen's tickets of 5 for 25c, have been abolished. Neither the city nor the company was satisfied with the decision of the Tramways Commission and as the result of appeals to the Public Utilities Commission, the new fares as outlined have been ordered. After the evidence of Mr. J. R. Bibbins, of Chicago, who was engaged by the city to investigate conditions, the case for the city fell down, and the City Attorney then asked that the decision of the Tramways Commission be upheld. The appeal of the company was mainly on the ground that the estimates of the Tramways Commission were insufficient to meet the obligations. The Public Utilities Commission, in their judgment, examined each main item in detail, and came to the conclusion that the company's contention in the matter of maintenance and renewals is justified, and consequently the sum of \$248,326 is added to that amount.

The Commission was supplied with a long list of cities in which fare increases have occurred, most of them in 1918. "Comparing rates in places of similar size and importance to Montreal the tariff we have adopted can by no means be considered burdensome. Also when we take into account the capital cost involved and the operating conditions in Montreal, also the present condition of the system, the outlay in operation and maintenance are far more excessive."

Montreal Tramways Cost-of-Service Plan

By Mr. J. E. Hutcheson*

In 1916 the Montreal Tramways possessed on the Island of Montreal, under its name or under the names of the companies absorbed by it, franchises in thirty municipalities; twenty-seven of which were exclusive; twenty-three, terminable between the years 1922 and 1961, and seven, interminable. The contract with the city of Montreal as it existed in 1892 was of thirty years duration, expiring in 1922. The company's system was operating under fourteen municipal councils.

The consideration for the use of the streets in the city of Montreal was an annual payment on the basis of a percentage of the gross earnings which applied only to the revenue from operating within the city limits as they existed in 1892. The tariffs, with free transfers, in each municipality were fixed for the duration of the respective contracts. In 1916 the average fare per revenue passenger on the entire system was 4.12 cents, and for total passengers 3.04 cents.

From time to time, during several years prior to 1917, the city requested the company to make extensions of tracks in municipalities which had been annexed. While admitting that in certain sections there was need of further service the company maintained that the city of Montreal could order extensions beyond the contract requirements in the areas annexed only by making a new contract covering such annexed areas.

This led to negotiations between the city and the company. No progress was made until the Provincial Legislature, in 1917, passed an act creating a commission of five prominent citizens of Montreal to prepare a contract that would safeguard the interest of the citizens and the shareholders of the company; such contract to become law when signed by the members of the commission and the company, and ratified by the Legislature.

After thoroughly studying the matter the commission unanimously concluded that a form of service-at-cost plan was the only equitable basis upon which a street railway franchise should be made. The company agreed to negotiate on this basis, and finally on Jan. 28, 1918, a contract for a period of thirty-five years, covering the company's entire system was signed by the officials of the company and the commission. This was ratified by the Provincial Legislature on Feb. 9, 1918.

The new contract provides for the "Montreal Tramways Commission," consisting of three members appointed by the Lieutenant-Governor in Council, to serve for ten years. This commission has control of the service—may fix the speed of cars; may establish routes, stopping and transfer points; may fix passenger density per car-mile; may stipulate types of rolling stock and of track construction; must approve of all renewals and extraordinary maintenance expenditures, and is empowered to examine and audit all receipts and disbursements. The necessary expenses incurred by the commission in the performance of its duties are to be paid by the company and form part of the operating expenses.

Any party in the case may appeal to the Quebec Public Utilities Commission from any decision of the commission on any question of law or jurisdiction relative to the contract, as well as from any decision rendered by the commission relative to the provisions of the contract. Such appeal shall be final, except on questions of law.

The act provided that the Montreal Commission

should make the tariffs uniform for the territory comprising the city and the five municipalities within the city limits; such territory to be known as the "uniform tariff territory." Outside this territory the commission may fix different rates providing that these do not unjustly burden the rest of the system, and providing further that the municipalities outside the territory may, with the consent of the commission, agree to pay the company any part of the excess of their respective services for the purpose of obtaining lower rates.

Guarantee Fund is Provided

The company by yearly installments of not less than \$100,000 is to provide out of its own resources a special fund of \$500,000 to be known as the "guarantee fund," to be used to meet all liabilities and other debts (except mortgage debts) incurred by the company, prior to the coming into force of the contract, through the operation of its system, and to provide for the payment in each year of any portion of excess expenditure as hereinafter defined, which shall be found by the commission to have been unnecessary for the payment of penalties imposed upon the company, and also to guarantee fulfillment by the company of all obligations assumed by it. This fund when created is to be maintained by the company at \$500,000.

The gross revenues of the company are to be disposed of for the following purposes and in the following order: (2) Maintenance and renewals fund; (3) Return on capital value; (4) City Rentals; (5) Contingent reserve fund; (6) Division of surplus.

The commission for the first year of operation is to allow the company out of gross revenues a sum for each revenue car-mile, under certain specifications as an operating allowance. The company is so to increase the transportation service, under the direction of the commission, that the permissible average density of traffic per car-mile, during the first year of operation under this contract, shall not be excessive. Thereafter the commission is to redetermine and fix annually the amount of operating allowance and permissible average car-mile density, based upon the experience of the preceding year.

Company is Allowed an Operating Profit

If at the end of any year the commission shall find that the company has kept within $2\frac{1}{2}$ per cent. of the operating allowance the company may take out of gross revenues a sum to be known as the "operating profit," which shall be equivalent to one-eighth of 1 per cent. on the total average capital value for that year. Any excess over the above expenditure is to be known as the "excess expenditure," which is to be taken from the gross revenues to an amount not exceeding one-eighth of 1 per cent. on the average capital value for such year, and the operating profit shall be reduced accordingly. And if the excess expenditure shall exceed this amount the company shall receive no operating profit, but shall pay such excess out of the guarantee fund, unless the company shall have been able to convince the commission that the excess expenditure was unavoidable. Then the commission is to permit the company to take out of gross revenues the additional amount required to cover such excess expenditures and also award the company the full amount of the operating profit less any part of such excess expenditures which may be found to have been unnecessary. If the unnecessary part exceeds

*General Manager Montreal Tramways.

the amount of the profit, the balance is to be paid by the company out of the guarantee fund.

For the purpose of maintenance, renewals, etc., a "maintenance allowance" per car-mile is to be placed in a "maintenance and renewals fund." The allowance is to be adjusted annually so as to maintain the fund at \$500,000.

Return on Capital Value is Set at Six Per Cent. in Normal Times

The capital value of the tramways system is fixed at \$36,286,295, including all physical assets added to the system up to Dec. 31, 1917. As its usual return upon capital value so fixed, the company is to receive in quarterly payments out of gross revenues a sum equal to 6 per cent. on such capital value. From time to time hereafter as money is needed for betterments, additions to and extensions of plant, required by this contract or approved by the commission, such money, except to the extent that monies for such purposes are payable at the time from the maintenance and renewals fund, are to be supplied by the company, and the amounts so supplied and actually expended for

other expenses incidental thereto when issuing bonds or debenture stock and for printing and engraving, transfer and registration fees and listing on stock exchange when issuing stock.

The city is to receive out of gross revenues, over and above all other amounts to which it may be entitled under the contract, or otherwise, the sum of \$500,000 per annum payable quarterly.

Other Financial Considerations

One per cent. of the gross revenue is to be paid annually into a contingent reserve fund, until this fund amounts to \$500,000. This fund is to be used whenever it shall be necessary to make up any deficiency in the payments listed earlier in the order of priority therein established. Upon the termination of the contract, the company shall repay any monies borrowed from the fund and the total amount then in said fund shall be distributed as follows: to the city, 30 per cent.; to the company, 20 per cent., and to a "tolls reduction fund," 50 per cent.

All the portion of the gross revenue remaining after the payment of the charges described is to constitute the divisible surplus and is, at the end of each year, to be distributed as follows: to the city 30 per cent.; to the company 20 per cent., and to the tolls reduction fund, 50 per cent. The tolls reduction fund is to be held in trust for the patrons of the company for the reduction of tolls, and administered by the commission.

Provision for Reduction in Fares

Whenever at the end of any year the amount in the tolls reduction fund exceeds \$1,000,000 the commission may, and whenever the amount in said fund shall exceed \$3,500,000 the commission shall, reduce the fares or tolls of the tramways system. For this purpose of effecting said reduction, an amount not exceeding 25 per cent. of the total amount in such fund, at the close of the year preceding the year when such reduction is to be made, is to be taken out of the tolls reduction fund, and added to gross revenues, and the commission thereupon is to reduce the tolls to an extent that, in the aggregate for the year, is at least equal to the amount so taken out of the tolls reduction fund, but does not exceed such amount, plus 75 per cent. of the amount which during the last preceding year flowed from gross revenues into the divisible surplus. Thereafter, at the beginning of each year, an amount shall be taken from the tolls reduction fund and turned into gross revenues equal to the amount so taken from said fund at the time of the reduction of tolls; but when the total amount remaining in said tolls reduction fund at the end of any year is less than the amount taken annually from such fund for the increase of gross revenues as above provided, the appropriation from such fund to gross revenues shall for the time being be discontinued, but the tolls shall remain as previously reduced until it shall be necessary as hereinafter provided to increase them.

If the tolls reduction fund, in spite of its depletion for such reduction in tolls, shall again increase to an amount in excess of \$2,500,000, the tolls shall be further reduced.

If in any year the gross revenue shall be insufficient to provide for the payment of all sums mentioned, and if the contingent reserve fund is less than \$300,000, the commission shall forthwith from any monies in the tolls reduction fund appropriate the amount necessary to bring the contingent reserve fund up to \$500,000. If there is not sufficient money in the tolls reduction fund, the commission is forthwith to increase the tolls to the extent necessary to provide at least sufficient gross revenues to meet all the payments described earlier.

Montreal Tramways Cost-of-Service Plan

such purposes under the supervision of the commission shall, plus net interest expenses during construction, be added to capital value, and the company is to receive out of gross revenues an annual return of 6 per cent. on such amount.

As the capital established at the sum of \$36,286,295 does not include any working capital, it is agreed that any working capital required shall be furnished by the company, and upon this working capital the company shall receive a return of 6 per cent.

For the purpose of covering the expense to be incurred by the company in procuring additional capital it shall out of gross revenues receive annually an amount equivalent to one-half of 1 per cent. of \$36,286,295, for discounts, commissions, printing and engraving, exchange, legal and

At the termination of the contract the tolls reduction fund is to be the property of the city.

The Application of the Contract Provisions in Practice

In conformity with the provisions of the contract the Tramways Commission on June 24, 1918, set the rates of fares as follows:

1. From midnight to 5 a.m., 15 cents.
2. From 5 a.m. to midnight, 6 cents cash or five tickets for 25 cents.
3. For school children from five to sixteen years of age, on week days and between the hours of 8 a.m. and 6 p.m., seven tickets for 25 cents.
4. Transfers shall be issued free to school children specified above, and to all passengers travelling on cars between 5 a.m. and 8 a.m. on week days only. At all other times a transfer shall be issued to any passenger paying his or her regular fare at a charge of 1 cent.

The car-mile allowance for the first period of operation under the new contract was set as follows:

Operating expenses and taxes—22 cents per car-mile for cars equipped with motors, and 15 cents per car-mile for trailers.

Maintenance and renewals—7.9 cents per car-mile for cars equipped with motors, and 5.2 cents per car-mile for trailers.

This decision was appealed and the Quebec Public Utilities Commission rendered its decision on Sept. 20, 1918, fixing the rates as follows:

1. Day tariff, 6 cents or a ticket sold at the rate of five for 25 cents.
2. School children, a ticket to be sold at the rate of seven for 25 cents.
3. Special day tariff of a ticket to be sold at the rate of six for 25 cents, to be good only between the hours of 6 and 8 a.m., and 5 and 7 p.m. on week days only.
4. Night tariff, 15 cents cash.

Each passenger paying a fare shall be entitled to a transfer free of charge.

As the Quebec Public Utilities Commission did not fix any allowances per car-mile for the expenses of operation as provided for in the contract, the Tramways Commission on Oct. 2, 1918, fixed these as follows:

Operating expenses and taxes—20.1 cents per car-mile

for cars equipped with motors, and 13.7 cents per car-mile for trailers.

Maintenance and renewals—7.33 cents per car-mile for cars equipped with motors, and 4.8 cents for trailers.

This gave an average allowance per car-mile for operating expenses and taxes of 19.93 cents and for maintenance and renewals of 7.26 cents.

The actual costs for the twelve months ending June 30, 1919, were, for operating expenses and taxes, 21.74 cents, and for maintenance and renewals, 7.26 cents. As the company justified before the commission the over expenditures made during the year, the actual cost per car-mile was allowed.

The company did not receive the full benefit of the increased rates of fare during the year, as they only became effective from Oct. 3, 1918. The average fare per revenue passenger increased from 4.1 cents to 4.8 cents after the new rates came into force.

For the year ending June 30, 1920, the Tramways Commission by its decision rendered on Aug. 29, 1919, fixed the rates of fare as follows:

1. Day tariff—from 5 a.m. to midnight 7 cents cash, or a ticket to be sold in series of four for 25 cents.
2. Special day tariff—tickets to be sold in series of five for 25 cents, to be good only between 6 and 8 a.m. and 5 and 7 p.m., on week days only.
3. The present outside night tariff and school children's tariff to remain in force.

The car-mile allowances are as follows:

Operating expenses and taxes—24.7 cents per car-mile for cars equipped with motors, and 17.4 cents per car-mile for trailers.

Maintenance and renewals—8.54 cents per car-mile for cars equipped with motors, and 7.05 cents per car-mile for trailers.

The above decision was appealed against by the city as being too high and by the company as being too low. Experts from the office of Bion J. Arnold, engaged by the city, were heard and they supported the company's figures. Arguments by counsel for both sides closed on Oct. 2, and judgment will be rendered in the near future, which I feel sure will not be more unfavorable to the company than to confirm the Tramways Commission decision of Aug. 29.

The Prospects of Railroad Electrification In America and Abroad

By Mr. F. H. Shepard*

The world-wide shortage of coal during the great war has emphasized more clearly than ever the necessity of fuel economy in industry, while the present shortage of labor and the certainty of its continuing scarcity throughout the construction period forms another most serious problem. But fortunately we have at our disposal a means that will greatly assist in alleviating both of these conditions; namely—electrification.

The use of electricity in industry saves both fuel and labor. This fact is recognized throughout the world today and in order to secure these advantages, practically all of the nations are now considering plans for the electric generation of power. In England, Belgium and France, among others, these plans are being prepared by official commissions, so that a tremendous activity in electrical power development may be expected with the stabilization follow-

ing the advent of peace. In all cases, the ideal in view is a broad one: To use electricity for all possible power purposes, including railroad operation.

The operation of the railroads will naturally form an important part of any program of general electrification, for in almost every country the railroads form one of the largest users of fuel and labor. Nor are the advantages obtained from railroad electrification limited solely to economy in fuel consumption and the more effective use of labor. Among others, the following can be mentioned:

1. Greater speed of movement for the heaviest trains, due to the fact that electric locomotives can be made much more powerful than the largest steam locomotives.
2. Greater nicety of control.
3. Increased traffic capacity of existing tracks, terminals, grades, tunnels, and other points of traffic restriction, because when electricity is used, heavier trains can be

*Director of Heavy Traction, Westinghouse Electric & Mfg. Co

operated at higher speeds and less time is consumed at terminals and in yards.

4. Operation where the use of steam is impossible or objectionable, as in long tunnels.

5. Independence of weather conditions, since the electric locomotive is not effected by cold weather.

6. More reliable operation, as proved by the statistics of all existing electrifications.

7. More effective use of all rolling stock, due to more expeditious movement of traffic.

8. These are some of the advantages that are now being obtained for the mere substitution of the electric locomotive for the steam locomotive, but they by no means tell the whole story.

Consider electric illumination. When first introduced, the electric lamp supplanted a gas or an oil light because of certain advantages it possessed, and at first it occurred to no one that it would ever do much more. But the electric lamp has within thirty years revolutionized illumination and has given us our light-flooded factories, with their greatly increased production and safety, and our Great White Ways as well.

A further example is the growth of our great city and interurban electric transportation service of today from the substitution of the electric motor for the horse on street cars.

There is good reason to expect that the electric operation of the railroads is capable of a similar development and will in time revolutionize our present transportation methods and provide us with services we know little or nothing about today.

Since the United States has an abundance of coal, railroad electrification here has been determined solely by local conditions. Passenger terminal problems caused the electrification of the New York Central at New York and the Pennsylvania at New York and Philadelphia. The limitations of the steam locomotive determined the electrification of the Baltimore tunnel on the Baltimore & Ohio, the Cascade tunnel on the Great Northern, the St. Clair tunnel on the Grand Trunk, the Hoosac tunnel on the Boston & Maine and the Detroit River tunnel on the Michigan Central. Examples of electrified railroads with freight as well as passenger service are the Norfolk & Western, the Chicago Milwaukee & St. Paul and the New York, New Haven & Hartford.

While the other electrifications are successful and interesting, the last three are more properly representative of general railroad electrification. The Norfolk & Western is an example of electrification under the heaviest conditions of freight traffic on a mountain grade. The Chicago Milwaukee & St. Paul has in operation the longest continuous mileage in the world, and when completed will cross five mountain ranges. The New York, New Haven & Hartford has a very large movement of both freight and passenger traffic. All three installations are successful and profitable and, when financial conditions are stabilized and the American railroad question settled, it is expected that all three will extend their electrified service.

In addition there are sections of railroads about the country where the present congestion of traffic or the availability of water-power warrants the early adoption of electric power. These possibilities alone promise under normal conditions of finance (as no engineering problems now remain to be solved) extensive activity in the electrification of railroads for many years to come.

Different from America, European and South American countries, with the exception of England alone, lack an adequate supply of fuel, but many of them including Nor-

way, Sweden, Switzerland, Italy, Spain and Brazil, have large amounts of water power, while France has a moderate amount. These resources combined with the high cost of fuel make extensive railroad electrification in these countries inevitable sooner or later.

The neutral countries will probably be the first to undertake this work, Switzerland having a program covering a term of years well established, while both Norway and Sweden are giving active consideration to definite projects. In England, a considerable amount of electrification is in contemplation along with the general plan for the electrification of industry. A French Commission, composed of Government and railroad engineers, have already visited the United States in order to thoroughly familiarize themselves with American practice. The Italian Government will continue their definite program as soon as financial conditions permit. An official Belgian Commission is already planning to rehabilitate with electric power at least a portion of the railroads destroyed by the Germans. In Spain, Brazil and South Africa as well, railroad electrification is under active consideration.

It is evident, therefore, that the next decade will see a large amount of railroad electrification in almost every quarter of the world.

Montreal Electrical Luncheon Club

At the meeting of the Montreal Electrical Luncheon on Oct. 8 the following were elected officers for 1919-20 season: president, Mr. W. H. Winter, Bell Telephone Co.; secretary-treasurer, Mr. T. H. Chennell, Bell Telephone Co.; Committee. Messrs. R. J. Beaumont, Shawinigan Water & Power Company; P. T. Davies, Southern Canada Power Co., Ltd.; W. J. B. Drew, Canadian General Electric Co.; C. Duncan, Duncan Electrical Co., Ltd.; M. C. Gilman, Montreal Light, Heat & Power Co.; L. A. Johnson, Northern Electric Company, Ltd.; E.S.M. McNab, Canadian Pacific Railway Co.'s. Telegraphs; R. Moncel, Devoe Electric Switch Company; W. P. Roper, Canada Wire & Cable Company, Ltd.; Wm. B. Shaw, Montreal Electric Company, Limited; H. W. Wood, Canadian Crocker Wheeler Company, Ltd.; Finance Committee: Messrs. J. W. Pilcher, Canadian General Electric Co., Ltd. (chairman); J. J. Sorber, Economy Fuse & Mfg. Co. of Canada, Limited; C. Thomson, Fred Thomson Company, Limited; J. B. Woodyatt, Southern Canada Power Company, Ltd. Luncheon Committee: Messrs. S. W. Smith, Electrical Equipment Company, Ltd., (chairman); and A. J. Carroll, Eugene F. Phillips Electrical Works, Ltd. Entertainment Committee: Messrs. A. Dwight Smith, Northern Electric Co. Ltd. (chairman), and E. W. Sayer, Sayer Electric. Papers Committee: Messrs. G. E. Templeman, Electrical Service Commission (chairman); J. A. Shaw, Canadian Pacific Railway Co.; P. S. Grégory, Shawinigan Water & Power Company; P. A. McFarlane, Bell Telephone Co. of Canada, Ltd.; G. C. Read, Civic Investment & Industrial Co.

Lieut. H. P. Ilsley, R. A. F., Croix de Guerre with star was the speaker. He spoke on "Aviation", relating his experiences as a pilot and observer in France. Corps flying was described as consisting largely of keeping contact between the infantry and the command by flying between two layers of British barrage and at the same time dodging German shells and machine gun fire. Scouting and bombing were referred to as being particularly dangerous work, the casualties of which quickly exhausted the personnel of the flying squadrons, making constant reinforcements of men and machines a necessity. Lieut. Ilsley repudiated the general belief that flying men were supermen and heroes, saying they had a better time than the infantry, although their work was hard on the nerves.

The Contractor-Dealer

Developing the Farmer's Trade

The dealer in farm lighting and power plants should not fail to take advantage of the organization among farmers represented in many sections in Canada by the U.F.O. It is easier to influence this class collectively than individually, and it saves both time and expense. The strength of the farmers' organization is shown by the recent Ontario election, where some forty odd U.F.O. candidates were successful. Salesmen of farm plants should see to it that their members of parliament are "sold" the idea of electric light and power for their constituents—that they carry back from their first visit to the seat of government a firm conviction that they have some good news for the farmer, something that will put him on a par, both as to convenience and luxury, with his city cousins. The matter of "the price" is no longer the important factor with the farmer that it was ten years ago. Witness the spread of the automobile industry among the country folk. The cost of a light and power plant is about the same as the cost of an automobile—perhaps less, for the farmer doesn't buy a cheap car—and it surely should not be difficult to advance as many arguments on the merits of an electric plant as on a motor car—keeping the young folks at home, the power features, the possibilities for a water supply, safety from fire around barns and stables, all-the-year-around availability—not like a motor car, which must be put into storage with the approach of bad roads.

The farmer is the next logical field for electrical development and the better he is organized the easier it will be to convince him. Take full advantage of the U.F.O.

Making it Another "Electrical" Christmas

The Society for Electrical Development, United Engineering Societies Building, New York City, is launching a smashing big campaign to help get more and better business out of the coming holiday season. It will be called "An Electrical Christmas" and it is promised that it will be all that the "Electrical Christmas" was in 1917 and more. Here is an advance list of the sales helps being prepared:

Special Features

The poster: Partly owing to the printers' strike in New York, but mainly because of its great success, the same poster design will be used this year as in 1917. A reproduction of the design, without its seven colors, is shown herewith; size 28 x 36.

Window cards: Including the poster design and a compelling sales message; in colors, 11 x 22.

Price cards: Set of 8 cards featuring electrical gifts that clean, cook, wash and iron, sew, light, etc.; complete for use; printed in colors on stiff cardboard, each 5 x 7.

Poster stamps: Always popular, always effective. Similar to the 1917 stamps. Stick them on your packages, letters, etc.

Suggestion leaflets: Little four-page folders suggesting over a hundred electrical Christmas gifts; for distribution through mails or from your store; two colors; room for imprint.

Printed Letters: Two-color printed letters which will

take the message "Give Something Electrical this Christmas" to your prospects; room for your imprint.

In addition to these business getting helps there will be cuts for newspaper ads., lantern slides, motion picture films, newspaper items—everything to make the campaign a big success.

The following prices are being charged

Material	Members	Non-Members
Window lithos. (Posters) 28x36	Free	Free
Window cards 11 x 22	Limited quantity free	Two free, additional 10 cents each
Price cards 5 x 7	1 set free, additional 25 cents per set	25 cents per set
Poster stamps	500 free, additional \$3.50 per 1000	\$3.50 per 1000
Suggestion folders	500 free, additional \$5.00 per 1000	\$5.00 per 1000
Printed Letters	100 free, additional \$2.00 per 100	\$2.00 per 100

The campaign is open to everybody in the industry.

Dealers' Christmas Helps

A Christmas advertising campaign that should bring good results to the dealer is now in preparation and will be run shortly, by the Northern Electric Company on the Manning-Bowman line of irons, toasters and percolators and their own line of sewing machines and vacuum cleaners. In twenty-five of Canada's leading daily papers, there will be an exceptionally good advertisement on these electrical appliance lines, featuring "Making Christmas an Electrical One." The size of this advertisement will be of a generous space and be run frequently during the month of December. A special Christmas folder printed in four colors, green, red, gold, and black—attractively made up, will be sent to the dealers and arrangements will be made to imprint the dealer's name and address. Along with this, they are also arranging to forward to their dealers photographs of window displays. New show cards showing the company's vacuum cleaners and electric sewing machines have just been designed for this Christmas campaign. They are claimed to be the most elaborate and attractive show cards ever offered to the Canadian trade and will go a long way to create both in a pleasing atmosphere and an actual value. This should be one of the most complete campaigns ever offered by a Canadian manufacturer or jobber to assist the electrical trade.

Proper Shop Lighting

The Commissioner of the Iowa Bureau of Labor Statistics says: "Modern shop engineering places great stress on proper shop lighting. No other agency is more conducive to accident than poor light in factory, work shop or other place of employment. Many of the establishments in Iowa are housed in other than buildings constructed upon modern plans, with the result of miserable lighting facilities, endangering life and limb, and ruinous to eyesight, the latter in turn productive of greater accident hazards. Provision should be made to provide an abundance of light, based upon approved modern lighting principles."

Business-like Ideas on Getting Contracts—Extracts from "Electrical Contractor-Dealer"

Interviews with Men Who Have Proven Their Worth

A Sign on the Job Under Way

"It may not be an entirely new idea, but I am at least using it in rather a new way," says an electrical contractor recently in speaking of plans to obtain contracts. "And it's simple enough, too, for it's just a good-sized sign carrying my name on the job that I am doing."

The placard was exhibited. It was of a size about 12 x 18 inches, bearing the contractor's name and address, preceded by the wording, "The Electrical Work on This Job Is Being Done By," and followed by a brief expression that all kinds of electrical installations are handled. This is lettered in an attractive and eye-compelling manner on a sort of canvas, with one smooth side, making the sign good for extended service and far more substantial than on heavy paper, as ordinarily found. This placard is fastened to the front of the new building in course of construction with the use of small wood strips around the four corners, insuring constant preservation.

"I do not wait until I begin my work on the job to put up this sign," continued the contractor, "but arrange to display it as soon as the front wall is of sufficient height. The building contractor, as well as the owner, will invariably let me do this, and I get the benefit of this publicity notice almost from the time the work starts to its completion. If it is a big building, I use two signs, and even three, at times."

"Can you trace new orders from this?" he was asked.

"I certainly can," he replied, "one or two of the nicest jobs I ever had came as the result of inquiries from such signs. The more prominent the new building location, the greater the opportunity, of course, for catching the eye of possible prospects—and you never know who is a prospect for electrical work; it may be a new house, office building or store, or the wiring of an existing building. But I mentioned that I was using the sign in a rather new way; this is what I do:

"After my notice is on the building, I arrange with a local photographer to take a picture, showing as good a view as possible of the new structure, and, of course, bringing out my sign prominently—in truth, I frequently have this intensified on the negative. This is a professional photographic job, and the result is always pleasing. Photographs attract attention, so one of these goes up on my window right away; in fact I always keep two or three photographs of current work on my window, with caption beneath explaining the job, its locality in town and any other necessary details. These photographs attract the attention of passers-by throughout the day; during busy hours, I frequently find two, three and more people looking at them. This I consider as good and very inexpensive publicity work, and as I have said, it has brought new contracts to my shop."

"But I am not through yet. The representative newspaper of the community has a building section once a week, and quite naturally, in boosting local affairs in this line it likes to brighten up its page. So, while the work is fresh, or as soon as the photograph has been made, I furnish a print for this purpose—and again, at practically no cost, I am advancing the interests of my business with an eye to new prospects."

"There is still one more use I make of these photographs," continued the electrical contractor, "but this is a little outside of my regular plan. I am speaking of the movie houses. When I have a particularly interesting job

and I think that the time is opportune, I have a slide made of the photographs, or it might be two, and these are flashed at a couple of the local theatres. It all helps, you know."

The Use of Reading Notices

In another city there is an enterprising electrical contractor who is a strong advocate of little "liner" advertisements and reading notices. He claims that this is consistent and persistent publicity at very small expense, and it bearing excellent fruit. He was asked how the plan was worked.

"Why do I believe in little liner advertisements? Well, just because they bring me new business and often from the least expected quarters. When I spend a dollar for my business, I want that dollar to count. I never went in for other advertising and don't think now that I ever will—at least, not as long as my present plan is pulling so well."

"Our local newspaper has a big circulation throughout this section; it is an evening daily, alive and up-to-the-minute; it goes for miles around, reaching all classes of people. This paper allows for little liner insertions. Sometimes these are placed at the bottom of a column, sometimes in the middle, and in fact, about wherever they can be arranged in connection with the make-up. I have worked up a series of good short notices, running two and three lines, on the average, setting forth such terse suggestions as: 'Wire your home now.' 'Enjoy the ease and convenience of electric service—wiring a home costs very little.' 'Electrical contracting of all kinds,' and so on, followed by my name and business location."

"These are inserted in different parts of the paper, from the front page to the back, sometimes running as many as six to eight different expressions in an evening edition. I used to be of the opinion that dividing the series a little and being in the paper every night was the best plan, but recently I have rather changed my view. I now alternate, running the announcements or notices one week on Monday, Wednesday and Friday, and the following week on Tuesday, Thursday and Saturday."

"This plan allows me to concentrate more fully in the editions in which the notices appear, and incidentally, it doesn't make them quite so common. Every other night, you see, I come back all the stronger, with my name and business as an electrical contractor showing on every other page or so. A real estate page is printed in the paper about twice a week, covering all sorts of news of this kind, as new building work, exchanges, sales, mortgages, and so on. I arrange to be on this page, usually, sometimes three and four times, as many readers are possible prospects. I consider it a valuable page."

"This little idea has brought me many inquiries and considerable actual business; it has been very profitable, and has given me leads on prospects for both large and small work that I do not believe I would have come in contact with in any other way. Occasionally I arrange for a little news item covering a list of some of the work I may be doing at the time, or other pertinent information, and this helps, too. The paper will insert these at no cost, as they are of current news value to realty interests, in which department of the paper they are usually used. This is just driving home my line once more, and I try to make them of the class and character that goes to build prestige."

Co-operating with Building Interests

Still another electrical contractor secures practically all of his new business through local realty and affiliated interests. He keeps in close contact with architects, builders and real estate men of all kinds. He goes to see them, he

telephones them, and he co-operates with them. He is after business and they know it, and there is little worth while going on locally that he isn't informed of. He is live and active, as may well be imagined, and never leaves a stone unturned in connection with securing a possible contract.

His plan is as simple as it is effective, and can be summed up in the expression, "a good mixer." This personal solicitation work he handles himself—he has the contact, and he wants to keep it. He believes it is more desirable to be on the outside than on the inside, and accordingly has developed his business to have a good substitute in the office at all times—a man who is possibly as competent to handle such matters as he, himself.

Hardly a week goes by without a personal call on these different interests; it is a systematic and regular occurrence, and if it does become impossible through unforeseen circumstances, a telephone call surely takes the place. The little calls and visits are just of the length that the one being seen might desire, for if this party will talk, the policy is to let him, particularly as in that talk an intimation of possible new business is likely to come out.

The general findings and conditions are not trusted to memory, but jotted down immediately upon leaving the office or establishment, if not before, and following, are recorded carefully on card files at the contractor's office. Where pending matters will come to a head within say a week or two subsequently, these are arranged in a "tickler" file under the proper date. Nothing is missed—it is a business proposition from start to finish, and takes the place of advertising, publicity, or other forms of promotion.

Then there is a spirit of co-operation and reciprocity. This contractor tries to return little "tips" and this or that inside information as to new buildings, alterations, etc., about to be launched. This is spread in the right channels where it will not only do the most good at the immediate moment, but where it will later, upon maturity, present possibilities for a return of the favor with a contract for an electrical installation. Under these circumstances this is comparatively easy and comes about almost in the course of the day's work, for with numerous contacts and extensive "mixing" an interchange of advance plans and activities is only natural.

Take, for instance, a recent case. This contractor learned of a sale of a lot through a visit to the office of one of his real estate friends; he was fortunate enough to be there when the deal was closed. He immediately ascertained in conversation with the new owner that a dwelling was planned, and he recommended one of his good architect friends to handle the design and construction. It does not take much of a guess to mention the party getting the electrical contract for the work when the architect suggested prepared the plans. And this is only one of numerous illustrations that might be cited.

In telling the inner workings of the plan, the contractor says: "My present way of promotion is all the advertising I want. The big secret of the whole idea is to develop the right contacts and then work those contacts for all they are worth, using of course, diplomacy and tact as you go along. I do not see how an electrical contractor can fail to increase his business if he engages along these lines in the right way. For me, it's a winner."

Electrical Representation in C.M.A.

Messrs. Paul Sise, of the Northern Electric Co., Montreal, and H. W. Matheson, of the Canadian Electric Products Co., Ltd., Shawinigan, have been elected members of the executive committee of the recently formed Quebec division of the Canadian Manufacturers' Association.

Eight Morals for the Electrical Merchant

By Mr. Lester G. Herbert

1. The retailer who would succeed cannot be content to arrange his stock and then wait for customers to seek him out. People are much surer to go where they are invited and wanted, than where no one has even thought of them.

Moral—Keep building up live mailing lists and classify these into groups such as the automobile owner, the house-keeper, the bachelor girl who does light housekeeping, the society girl, the traveler and so on.

2. Be courteous, not in the Lord Chesterfield interpretation of the word, but in a brisk, business-like, interested, deferential manner. That which is deferential need not savor of servility. Nothing is so inexcusable on the part of the selling force as indifference.

Ascertain what a customer desires. If the statement of need is a bit indifferent, don't start to ask questions, for this antagonizes. If the query is, "Do you keep electric warming pads?" it is a mistake to say: "How big a one do you want? How much do you want to pay? What do you want to do with it?"

It is more tactful to remark:

"We do. I will show you several which we can recommend." It will take but a moment then of close observation to find out what the customer really needs and to swing the sale in that direction.

Moral—Courtesy and tact are twin sisters, the mother of them is Close Observation.

3. Never make the mistake of showing the cheapest article first, for first impressions are lasting, and the customer who has seen a cheap article is likely to declare himself suited with it and to be honest in his declaration. Show the better class of goods first, and if these prove too high priced, come down the line, and a satisfactory sale of good stock is sure to result.

Moral—You never can tell by the looks of a customer the extent of his buying ability.

4. Where large accounts are carried, mistakes sometimes occur in charges and credits. When a customer calls an item into question, it is fatal to act offended. Be open minded and state frankly that no one is infallible. Hear the customer's explanation and make prompt investigation. If you are convinced that the claim is correct, make the adjustment cordially and willingly. This will hold a customer. To do it grudgingly, makes them feel that they are liable to be taken advantage of if they don't watch out.

Moral—Do as you would like to be done by.

5. As nearly as possible see to it that all bills and statements are mailed the first day of each month. The early bird catches the worm, and the early statement gets the cash. To be careless about rendering accounts is to court disaster.

Moral—Close collecting is one of the secrets of success.

6. When asked to bid on a contract, be specific, stating the grade of materials used. This will often clinch a good-sized transaction, even when there are lower bidders.

Moral—Don't be afraid to tell of the quality of your stock and service.

7. "Advertising is the sunshine of business." Let the sun shine. It is better to do a little advertising regularly and consistently than to make a splurge once in awhile. Keep your store and service in the public eye and mind so that when needs arise you will be the one sought as a matter of course. Remember, people are not mind readers, and they may not realize what they need in your line until you tell them.

Moral—Modesty in business does not consist of keep-

ing quiet, but rather of never making exaggerated claims.

8. How many people in your territory, do you think, would be glad to have a handsome new dining-room lighting fixture, a few additional lights here and there, or an attractive reading lamp? Nothing makes home more charming and attractive than well-lighted rooms. Reach out to these people and make them special offers which will convince them that the time to gratify their desire is now.

Moral—There is no time like the present to do business if you only know what you want to do.

Making an Electrical Market on the Farm

By Mr. H. C. Stair*

The last two years have been very prosperous ones for the farmers, especially through the Mid-West. Money is plenty and the growing familiarity with power apparatus, through the general use of the gasoline engine and the automobile has, so to speak, whetted the farmer's appetite for more power. The limitations of the stationary or portable gasoline engine are so manifest and its bother so great that the farmer is a live prospect for electric power.

My experience in the electrical game began several years ago with a garage in which I had a gasoline engine driving a direct-current generator. My neighbors wanted electric service and starting with those on the block, I gradually extended the lines for several squares around. Cambridge is a village three miles from the railroad, but its people are progressive and want all the latest conveniences.

Financing a Transmission Line

The town of Janesville is some 15 miles away and has electric service from a local central station. I had been thinking that perhaps we could have one of those transmission lines that are built for miles across the country. One day when Harry Caird, Sales Engineer of Julius Andrae & Sons Company, was with me, I said something about this and he assured me that it was entirely practicable to buy our power from the central station. Mr. Caird and I drove over the route between Janesville and Cambridge and made an estimate of the cost of the line and the amount of business we could secure. We found that the wholesale rates of the Janesville Company would leave us an attractive profit, so we proceeded to incorporate the Cambridge Light & Power Company and sell stock largely to the farmers who would benefit by the line. Work was started in the summer of 1918 and power was turned on Oct. 27. We secured an experienced line-construction foreman from Mr. Caird, and one or two linemen; the rest of the gang were picked up locally.

In all, we constructed 14 miles of main line and three branches, totalling 3½ miles. These branches were paid for by the farmers served. All farmers payed for their own protective devices and service wiring. These transformers range from 1 to 5 kv.a. In Cambridge, we placed two 25-kv.a. transformers and connected them to the 110-volt distributing system. In three small communities en route, we placed transformers at our own expense.

Keeping the books and collecting bills takes only about one-fifth my time, so in the remaining I conduct an electrical supply business. The Light Company does not sell appliances or do house-wiring, so nearly all this business comes to me. When I state that we have two-hundred consumers of which about half live in Cambridge you will see that this is a market worth cultivating and extending.

What One Farm is Worth

The average farmer will need a transformer, lighting fixtures, household appliances, a pumping outfit and at least

one other motor. They are all eager for service and we can connect them up as fast as the lines are built.

On the average, a farmer will have in his house a water-pump with automatic control delivering into a pressure tank; a vacuum cleaner; an electric iron; and a washing machine. In his barn he will have a 10-horse-power motor driving a feed mill and a ¾-horsepower motor driving a line shaft to which is connected the separator, churn, and water pump for the stock. He will have the usual lighting fixtures in his house, and lamps in the stables, cow sheds, feed-room, and one or two in the yard. These are arranged to light the paths between house and buildings and are controlled from three or four places by four-point switches. In addition, each farmer can be counted on for one or more additional devices, such as table appliances, meat choppers, buffers and grinders, or a general-utility motor to be moved around as the work requires.

The farmer has plenty of money; he pays promptly and he has learned to value his own time and labor. If you can show him, you can sell him, and the business is there if you'll go after it.

Manufacturing Electric Furnaces

The Volta Manufacturing Company, of Welland, recently installed two 6-ton capacity furnaces in Hamilton and a 1-ton furnace at Walkerville; they also recently shipped a 6-ton furnace to one of their customers in New Zealand, to be used in manufacturing steel. This company manufactures electric furnaces up to 10-ton capacity for use in making steel, pig iron, grey iron, calcium carbide, ferro-silicon, ferro-manganese, ferro-chrome and other iron alloys. These furnaces are designed especially to meet the particular purpose for which they are installed, the company making a specialty of furnaces of the tilting type for the manufacture of electric steel. In addition to furnaces, they also manufacture electric furnace accessories of all kinds, such as automatic regulators, hand controllers, current transformers, electrode holders, roof coolers, electric winches and magnetic brakes; also travelling cranes and mono-rail systems, etc. They also build special equipment as called for and do general consulting work. The manager of the company is Mr. J. Young.

D & W Fuse Co. Representatives

The International Machinery and Supply Company, 421 St. James St., Montreal, have been appointed by Mr. W.S. Sisson, sec.-treas. of the D.&W. Fuse Co., Providence, R. I., sole representatives for the Montreal district, to handle their complete line of enclosed fuses and cutouts as well as their well known Deltabeston wires, cords and other specialties. One of the most important lines manufactured by the D. & W. Fuse Company is their oil cutouts, for both pole and railway service. These are in use all over the dominion and the United States, and are made from 2,500 volts to 16,000 volts. Catalogues of the complete line will be furnished on request to the International Machinery & Supply Company. Mr. R. J. Hiller, manager of the electrical department of the company, is to be congratulated on securing this agency.

Mr. Kelly Will Visit the West

Mr. Thos. F. Kelly, sales manager of the Hoover Suction Sweeper Company of Canada, Limited, will shortly take a trip to the Pacific Coast for the purpose of opening up new dealer connections. Mr. Kelly expects to leave Hamilton about the 5th of November, and will stop at Sudbury, Sault Ste. Marie, Port Arthur, Fort William, Winnipeg, Portage la Prairie, Brandon, Moose Jaw, Saskatoon, Edmonton, Regina, Calgary, Victoria, Vancouver and New Westminster.

*President, Cambridge Light and Power Company, in "Contact."

Mr. Goodwin and Mr. Corcoran Speak on Merchandising at Buffalo Electric Show— Fifty Ontario Delegates in Attendance

Close upon fifty members of the Ontario Association of Electrical Contractors and Dealers ran over to Buffalo on Friday afternoon, October 24, to see the electric show being staged there and hear Mr. W. L. Goodwin again. There were representatives from Toronto, Hamilton, Kitchener, Brantford and other Western Ontario cities where the fever for "better merchandising" has seized the members of the various branch associations.

Mr. Goodwin had spoken at some length previous to the arrival of the Canadian delegates, but, for their special benefit, very kindly gave a brief resume of his previous talk. He outlined the changes that had taken place in the electrical industry during the past five years. Formerly the sale of electric current was the predominating industry; today it is the sale of merchandise to utilize the current. As much as 80 per cent. of the income of many central stations is from the sale of electrical appliances, the other 20 per cent. being derived from the sale of current.

The development of the past three or four years indicates that a tremendous increase in demand for electrical appliances may be expected during the next few years. That demand is becoming so great that our factories are unable to cope with it and central stations are unable to supply the current. There is more need than ever to-day under such conditions for the various sections of the industry—manufacturer, central station, jobber and dealers—to work collectively and in unison.

Mr. Goodwin again touched briefly on the question of discounts for quantity purchases. Price, he maintained, must depend absolutely upon the service rendered. The little dealer must have an equal advantage with the wealthy corporation. If the purchase of a thousand of a certain article demanded no more expenditure in the way of service than the purchase of a hundred, then the customer purchasing the smaller amount has a right to the same price. The theory of quantity discounts is wrong.

Mr. Goodwin also spoke briefly regarding the necessity for standardization. At a recent convention he had heard a manufacturer state that there were, at the present time, as many as a million and a quarter combinations in the manufacture of transformers. These, Mr. Goodwin believed, might be reduced to one per cent.; or, perhaps, one-tenth of one per cent. of this number. The object of the industry, as a whole, should be greater production, economical production and distribution, fair profit to the dealer and a fair price to the consumer.

He briefly disposed of the argument frequently raised that the jobber is an unnecessary factor in the business. He must have been reading the remarks of a certain commissioner, who recently stated, in Toronto, that he had always held the opinion that the jobber was a luxury in business. Mr. Goodwin said that the jobber's function could be performed by any other party or under any other name, but would still remain the same. The manufacturer may manufacture solely, or manufacture and distribute to dealers. In the latter case he also performs the function of a jobber. This explains why manufacturers were unable to give jobbers' discounts to contractors. If the manufacturer himself dealt directly with contractors, he was performing the function of a jobber as well as a manufacturer, and, in all fairness, should charge the expense of jobbing to this contractor.

He then briefly ran over his twenty-one planks which we have already printed in the Electrical News. He con-

cluded with an eloquent plea that we all get together to develop this growing industry—this infant, as he called it—into a healthy, husky adult.

Visualizing—A New Profession

Mr. Goodwin was followed by Mr. Corcoran, who commenced by saying that he was going to give his hearers a little talk on "visualizing." Visualizing, he said, was a new profession. For example, we speak of a certain motor revolving 1800 revolutions per minute, but we have very little conception of the meaning of this expression. Mr. Corcoran at this stage produced a coil of paper some three inches wide, which he unrolled and circled completely around the hall. On this coil were shown 1800 circles about 2 inches in diameter. "That," said Mr. Corcoran, "will give you some idea of the number of revolutions a motor makes in one minute. You get a dim impression with the ear; you get a much more definite and accurate impression with the eye—that is what I mean by visualizing."

Following out the same line Mr. Corcoran proceeded to illustrate, by means of charts, certain striking features in connection with the electrical industry. First he gave certain statistics dealing with the number of homes in the country, the number wired for electric light and power, the number of appliances used, the number of homes unwired and the possible market for more appliances.

Passing on, Mr. Corcoran spoke at length on the various features entering into a proper merchandising business. There was the store, its location, its exterior appearance, its interior appearance, the personnel of the staff, the fixtures, the interior arrangement, and so on. He outlined what he considered a fairly ideal characteristic of a salesman; he must be courteous, careful, energetic, neat, loyal, honest, intelligent and be properly seized of the value of giving service with every item he wrapped up. "Retail salesmanship," said Mr. Corcoran, "is a science today."

The arrangement of stores he divided into two classes—the jewellery type of store and the hardware type of store. The jewellery type specializes in only high-class goods. Service was as important as quality. The displays were never conglomerate or crowded. The salesmanship was intelligent and deliberate, and calculated to bring the customer back to the store. The hardware type of store was more on the "hand-out" type. It lacked the idea of service. This was largely because the hardware man had not the knowledge necessary to give service.

Mr. Corcoran showed a typical store plan which he conceived to be as nearly ideal as could be reached by the average dealer. It must have an attractive entrance with deep windows, well dressed. The ideal store would have two doors with space between for a showcase looking on the street. Lamps, for which there was probably the greatest demand, should be placed in the rear of the store so as to induce the greatest possible number of customers to pass the complete display. A demonstration room also should be placed at the back. The idea of arrangement throughout should be such that the customer would be forced to see as much as possible of the display.

A forest of fixtures is generally not an attractive display—though there may be exceptions to this, depending on the location of the store and the class of customer to be served. Showcases are always valuable—the day of keeping things hidden under the counter until people come and ask if you have them, is past. Use color whenever possible in your decorations; it helps to brighten things up. Use demonstrations to the limit. Make greater use of your telephone to effect sales, or to bring customers into your store to watch demonstrations.

"Finally," Mr. Corcoran said, "every article on sale

(Continued on page 47)

Here's a Christmas Present for You

YOUR WINDOW DISPLAY IS YOUR BEST SALESMAN

Between now and Christmas the Electrical-Dealers of Canada will be putting forth their best efforts to attract the holiday trade and some fine window displays will be shown.

The biggest problem before the electrical industry to-day is not engineering or manufacturing—the real problem is “merchandising.”

We believe that well dressed windows—goods properly and tastefully displayed and demonstrated—are the most effective means of increasing the sale of electrical appliances.

With a view to encouraging the art of window dressing among electrical contractor-dealers, and, also, having in mind the value of the interchange of good merchandising ideas, the Electrical News offers four prizes for best dressed windows, under the following conditions:

- | | | |
|-----|--|---------|
| (1) | First prize | \$35.00 |
| | Second prize | 20.00 |
| | Third prize | 10.00 |
| | Fourth prize | 5.00 |
| (2) | The contest is open to any electrical contractor-dealer, municipality or central station in Canada. | |
| (3) | Photographs of window displays must be in our hands by December 31, 1919. | |
| (4) | Explanatory notes up to 100 words may be submitted with each photograph. | |
| (5) | The merits of the photographs will be judged by an impartial committee of three—one manufacturer, one jobber, one contractor-dealer. | |

Plan now to enter the competition. You have an even chance to win a prize. In addition to that, however, it is a dead certainty that your effort to produce a better window display will be reflected in your more abundant Christmas trade.

Address photographs and all communications:

“Best Window” Contest,

Electrical News,

347 Adelaide St. W., Toronto.

What is New in Electrical Equipment

The Non-Twist Canopy Ring

The man who installs electric fixtures will appreciate the value of a new fixture part called the "Non-Twist Canopy Ring," which is now being placed on the market. The purpose of this fitting is to improve the present method of installing fixtures and canopies. The ring itself is a socket joint arrangement as shown in one of the illustrations herewith. In the actual operation of installing fixtures this ring is first connected with the lamp socket, loop or fixture arm, as the case may be, and the wires allowed to extend up from the fixtures through the ring. The wires are then threaded through the canopy and on through the "nipple" crowfoot where they are connected, soldered and taped in the usual way. The special value of the Non-Twist Canopy Ring is that it admits of the fixture being drawn up tight against the ceiling or wall without any twisting of the wires. In pointing out the main advantages of this fitting, the Non-Twist Canopy Ring Company also draw attention to the fact that this invention eliminates the use of the slip canopy

tention to make this fitting available to manufacturers of lighting fixtures and to contractors and dealers. Announcement of the formation of the Non-Twist Canopy Ring Company appeared in the October 1 issue of the Electrical News.

Safety Starting Switch

Safety for the operator, safety for the motor and equipment and safety for itself are the three features embodied in a new type of starting switch for small induction motors that is being put on the market by the Westinghouse Electric and Manufacturing Company. The switch is absolutely accident proof, and well nigh fool proof as well.

The action of the switch is automatic, and consists of strong springs attached to the contact parts and controlled by a trigger. This trigger is released by overload, failure of power or by hand. When the switch passes the neutral point, the spring snaps it the rest of the way. The switch is shown in the accompanying illustration. Safety to the operator from injury due to contact with live parts. This is assured by the entirely enclosed, dust-and-dirt proof case. It is impossible to touch the live parts by accident for this reason.

Safety to the operator and equipment from restarting after the machine has shut down. When power leaves the equipment, a low voltage protective relay releases the trigger and throws the switch. Upon the return of power, it is necessary for the operator to move the handle first to the reset position and then to the running position, before the motor can again be started.

Any undue overload causes the overload relay to re-

and makes it possible in every installation, to bring the canopy flush and tight against the wall where it will remain firmly fixed.

Various heights of crowfoot are designed for canopies of various makes and size. A very flat crowfoot allows the use of shallow three-quarter inch canopy. For very deep canopies an extension tube is provided which forms a part of the crowfoot.

The various illustrations herewith will explain the device—Fig. 1, the non-twist canopy ring; a two-part ball and socket arrangement; Fig. 2, the crowfoot with the nipple as an integral part; Figs. 3 and 4, two forms of extensions—for ease in installation the wires pass only through the threaded end of the tubes and out through the loop; Figs. 5, 6 and 7, illustrating the various types of fixture installed with non-twist canopy rings.

This fitting is the invention of Mr. F. D. Parmenter, of Toronto, to whom patents have been allowed in Canada, United States and Great Britain. It is Mr. Parmenter's in-

lease a trigger which opens the switch the same as on failure of voltage. Overload throws off the switch just the same as no power, and the switch must again be reset before the motor can again be started. This overload relay prevents burn-out of the motor. Motor burn-outs may arise from two causes—an overloaded machine or the opening of one wire, due to the blowing of a fuse or other cause and subjecting the remaining phase to a double burden. The overload relay may be set to open the switch at any desired point, such as 105%, 110%, 150% of full load. Fuse protection is not sufficient to guard motors against burn-out. A fuse that will carry, without blowing, the starting current which is several times the operating current, will also carry, without blowing, sufficient overload to burn out the motor. The overload relay is provided with oil dash pots, which afford a time element, permitting the carrying of small peak loads and the starting current without interruption of service. However, they will allow the operation of the over-

load relay if the overload is heavy or is sustained long enough to threaten the motor. This insures the motor against burn-out and at the same time permits maximum production.

Replacing burned out fuses with copper wire when new fuses are not available, results in a burned out motor, the next time an overload occurs. This danger is eliminated because the new switch uses no fuses and automatically resets itself when the overload is removed. Besides this, the danger of shocks and burns in replacing burned out fuses is eliminated.

When the handle of the switch, moving toward the "on" position, passes the neutral point, the spring whips the contacts together. The same action takes place with the opening of the switch. This rapid opening and closing of the contacts, practically eliminates the injurious effects of arcing and preserves the life of the switch.

Asbestos barriers, between the sets of adjacent contacts, have permitted the omission of switch oil with all its accompanying fire hazards and other objectionable features. But when explosive gases are present and the danger of explosion is greater than the fire hazard, the contacts may be immersed in oil.

Emergency stop push buttons may be connected in the low voltage relay circuit and located at any convenient point near the machine. This switch has been approved by the National Board of Fire Underwriters. Two sizes are made, each for use on two and three phase motors, on voltage up to 600. Type No. 815 starts motors of 10 h.p. or less, while type No. 816 starts motors up to and including 25 h.p.

The "Kribs" Electric Washer

Mr. Gordon Kribs, for many years assistant engineer with the Hydro Electric Power Commission of Ontario, and, previous to that, with the Electric Power Company, recently resigned from the Commission to associate himself in business with his father, Mr. W. A. Kribs, in the manufacturing business in Hespeler, where Mr. Kribs, Sr., has been established for many years. The new firm will manufacture a complete line of domestic labor-saving appliances, including washing machines of the various types. We understand they intend making a specialty of a moderate priced washing machine which can be sold so as to place it within the reach of nearly all prospects. This machine is now on the market in limited quantities, and arrangements are being made to increase production. Considering Mr. Gordon Krib's wide experience in engineering matters, both theoretical and practical, contractor-dealers will look forward with keen interest to the electrical products of this company.

Electrical dealers should consider it as axiomatic that no householder or other customer has ever reached the saturation point in the way of electrical appliances.

Turn the Dark Days to Dollars Account

These are the days to sell new lamps, reflectors and lighting facilities generally. There is no denying the fact that good salesmanship consists, in considerable measure, in catching your prospect at the psychological moment—an electric iron on an intensely hot ironing day; an electric washing machine on a dreary wash day; a vacuum cleaner in the midst of dusty housecleaning and bright new lamps on

a dark rainy day in November. The meagreness of the illumination on a dark day suggests failing eyesight and encroaching old age; at such a moment the salesman with bright new lamps is a welcome and reassuring visitor.

Take advantage of the dark November days to see the offices and homes of as many of your customers as you can. There is much business waiting for you, not only in bulbs alone but in fixtures of every kind.

Don't Crowd Your Windows

The average window display, perhaps, endeavors to cover too wide a field. This has a tendency to divide the attention of the passer-by instead of concentrating it on some one item to the point of desire to purchase. The simple window also is easier to prepare and, further, admits

of more frequent changes without exhausting your supply of ideas. In the accompanying illustration the dominant note is "Solid Comfort" and the cause of it, the electric heater. In the back of his mind the observer will also see the soft, artistic floor lamp effect. There is nothing else to detract from the scene—solid comfort—warmth and light.

The Electric Service Company have just issued catalog No. 142, entitled "Keystone Mine, Telephone and Signalling Apparatus." This catalog is well illustrated and contains a quantity of very useful information on this subject.

Personals

Mr. A. Gaboury, superintendent of the Montreal Tramways Co., has been elected a member of the executive of the American Electric Railway Transportation and Traffic Association.

Mr. L. R. Morshead, consulting engineer, London, the British representative of the Eugene F. Phillips Electrical Works, Ltd., Montreal, has been on a visit to Canada and the U. S. The company have been busy on orders for Great Britain, Australia and South Africa.

Mr. Goodwin Speaks on Merchandising

(Continued from page 44)

should have a price card. An appliance without a price suggests to the customer that you have something to sell that you feel costs more than it ought to. On the other hand, a price ticket, prominently displayed, indicates that you have confidence in that appliance and are proud that it can be produced at so low a figure."

At the conclusion of the meeting Mr. Goodwin expressed his appreciation of the presence of so many Canadian delegates, and announced his intention of visiting Toronto again in January. The definite dates and program will be announced later.

The Lebron Buffing and Grinding Stand

The illustration below shows an electric buffing and grinding outfit to work in combination with garage air service; a practical outfit embodying many attractive features. Note its simplicity of construction and how solidly the motor is fastened to the stand. It is an outfit that will

Electric buffing and grinding outfit

stand up under the wear and tear of the busiest garage, performing three functions in one. It is sold exclusively in Canada by the Northern Electric Company.

Electrically-Driven Machine Opens 500 Letters a Minute

Opening mail at the rate of five hundred letters a minute, a mere fraction of the time occupied by the paper knife, a small electrically-driven machine is proving a highly effective builder of efficiency in business offices by saving money, time, labor and patience. With this machine, one person can open the mail in less time than five or more by the old method, and with greater safety and accuracy. Not only is confusion thereby reduced to a minimum, but responsibility is unquestionably centered. This machine built by the Bircher Company and known as the Lightning-

Letter opening machine

Opener occupies but little space and can be placed on any table, desk or counter, all litter thereby being confined to a restricted area. Attached to an ordinary lamp socket, it is set in motion, by a mere snap of a switch, through the medium of a Westinghouse motor mounted within the case and consuming an amount of power so small as to be almost negligible. The envelopes are placed on the feed table in a stack of forty or fifty at a feeding, and are conveyed automatically one at a time, by a feed belt, through two rapidly

revolving circular knives which cut a very small shaving from the exposed edge of the envelope. The letters are then carried automatically into a stacker.

Switch for Dimming Locomotive Headlights

A new locomotive headlight switch has recently been put on the market by the Crouse-Hinds Company, Syracuse, N.Y. It is a self-contained, dust-tight switch that will effectively perform the duties of a double-throw knife switch for shifting from dim to full light, and a momentary contact switch for temporary dim light.

With an easy push the handle goes from the "off" to the "dim" position and another slight push sends it to "full" position. While passing another locomotive or when picking up signals it is not necessary to bring the switch back to the "permanent dim" position. The engineer merely pushes the handle from "full" to "temporary dim," holding it until he has passed the other train or the signals, after which he

Locomotive headlight switch

releases the handle and the switch automatically snaps back to "full" position. If going through a yard or a city where the headlight must be dimmed, a slight shift of the handle brings the switch back to the "permanent dim" position.

The Quad Radiant Electric Heater

The Quad Radiant Electric Heater, which is shown herewith, is a unique idea which gives extreme flexibility in the way of a domestic heater. The various units of the

The "Quad" heater

group are separately controlled so that various volumes of heat are available. The units are also separately hinged so that a perfect distribution of heat may be obtained. It is manufactured by the American Electrical Heater Company, of Detroit.

The Electric Furnace Company, Alliance, Ohio, have issued three new booklets as follows: Booklet 7-B is a catalog of their standard 105 kw. brass melting furnace. Booklet 17-B describes a special furnace for rolling mills, which is designed for pouring the metal directly into the moulds. Booklet 13-B is a careful discussion of the various electric non-ferrous metal melting furnaces.

Westinghouse War Memorial Scholarships

The awards of the four annual War Memorial Scholarships of five hundred dollars each, established by the Westinghouse Electric & Manufacturing Company, have just been announced. These awards were made by competitive examinations and the following men were successful: Herbert S. Pahren, Cincinnati, Ohio, employed as order clerk in the Cincinnati office of the Westinghouse Company, and a graduate of the Hughes High School, who has selected for his scholarship a Technical Engineering Course at the University of Wisconsin; Arthur Marthens, of East Pittsburgh, Pa., began work as a messenger boy before completing his studies in the Turtle Creek Schools. Mr. Marthens, while working in the Cost Department, prepared himself in the Casino Technical Night School to enter college. He has chosen a course in Electrical Engineering at the Carnegie Institute of Technology; Paul O. Langguth, a graduate of the Wilkesburg High School, and employed as draftsman in the Engineering Department at East Pittsburgh, has selected as his award an Electrical Engineering Course at the University of Pittsburgh; Andrew P. Lesniak, a graduate of the Union High School, Turtle Creek, Pa., and employed in the Production Department at East Pittsburgh, has selected a course in Mechanical Engineering at the University of Pittsburgh.

Two classes of scholarships are provided: (a) For sons of employes of the company or its subsidiaries who have been employed for five years or longer. (b) For employes of the company and its subsidiaries who have been continuously employed for at least two years and who shall not, on September 1, have exceeded the age of 23. Not more than two class "B" scholarships will be awarded in any year. Each scholarship carries with it an annual payment of five hundred dollars for a period not to exceed four years, the payment to be applied toward an engineering education in any technical school or college selected by the successful candidate with the approval of the scholarship committee.

These scholarships have been established as a memorial to those employes of the company and its subsidiaries who entered the service of their country during the war. Four awards will be made each year, so that after three years this company will be maintaining sixteen of these scholarships in the best technical schools of the United States.

New Book

Elements of Radiotelegraphy—By Ellery W. Stone, member of Institute of Radio Engineers, United States Naval Institute. D. Van Nostrand Company, New York, publishers; price \$2.50 net. This text was written primarily for the guidance and instruction of radio engineers in the communication service of the Navy, but will be found helpful in radio instruction in other military branches, in civilian radio schools and for the self instruction of those interested in the subject. The physical, rather than the mathematical standpoint has been considered, so that the book may be useful to the layman. One hundred and twenty-five illustrations and 32 plates; 400 pages; size, about 5 in. x 7½ in., imitation leather.

Repairing Broken Resistance Grids

Broken resistance grids are often thrown away, because no adequate means of repairing them suggests itself. The following method is employed by the writer, and as there is no mechanical strain imposed on the grids, it has proved very effective. In nine cases out of ten the break occurs in a loop in the metal; by placing one iron washer under

and another over the broken section of the grid, and tightening them together with a short bolt or rivet, the broken parts will be held in position and will be as good as new.

Resistance grids for temporary service can be made with a strip of sheet iron. Cut the sheet from one side to within a short distance of the opposite side, and then repeat the operation from the other side, and so on throughout the strip. When pulled lightly by the ends the strip will resemble the regular grids. A hole bored in each end and it is ready to use.

Maurice S. Clement in "Electrical Record."

Physical and Mechanical Properties of Brass, Steel and Aluminium

Property	Brass	Steel	Aluminium
Melting Point, °C	950	1,400	655
Melting Point, °F	1,740	2,550	1,210

An attractive combination unit being handled by Nerlich & Co., Toronto

Current News and Notes

Almonte, Ont.

The town of Almonte, Ont., has taken an option on the Wylie power plant which will likely be taken over in the near future.

Bathurst, N.B.

Plans have been prepared for a hydro-electric power development at Grand Falls, on the Nepisiguit River, for supplying power to the Bathurst Lumber Co., Bathurst, N. B., in connection with their lumber mills and the new pulp plant. The current will be transmitted over a transmission steel power line, to Bathurst, a distance of 19 miles. Two units will be installed, provision being made for a third unit; each unit will be 4,500 h.p. The turbines will be of the vertical, umbrella type, direct connected to generators and will operate under a head of 100 feet. The dam and power house—the former 450 feet long—will be constructed of concrete. Mr. William Kennedy, Jr., of Montreal, is the hydraulic engineer, and Dr. L. A. Herdt, Montreal, the electrical engineer.

Guelph, Ont.

In addition to completing an investigation on matters in connection with the Street Railway here, the Ontario Hydro Commission has prepared estimates of the cost of an electric railway from Elmira to Kitchener, Galt and Dundas connecting with the contemplated lines from Toronto and London and to Niagara Falls as well as from Guelph to Preston and Galt.

Hamilton, Ont.

Supplementary letters patent have been issued to the Clemens Electrical Corporation, Limited, Hamilton, Ont., increasing their capital stock from \$50,000 to \$200,000.

Montreal, Que.

The Canada Brass Products, Limited, has been granted letters patent. They are empowered to deal in electric light fixtures, apparatus, fittings and so on, and the capital stock is \$50,000; head office Montreal. Mr. Louis Payne is at the head of the company.

Ottawa, Ont.

The Ottawa Car Company, Ottawa, Ont., are erecting a brass foundry on Slater Street in that city.

Peterboro, Ont.

Mr. W. S. Wrong, of the Hydro-electric Power Com-

mission, was recently in Peterboro in connection with the proposed Hydro radial route from Peterboro to Kinmount. Quebec, Que.

Enterprises Les Electriques, Limitee, have been granted a charter. The head office is in Quebec.

Toronto, Ont.

The Canadian Consolidated Corporation have been granted letters patent to conduct a general electrical business. The head office is at Toronto and the capital \$110,000. Mr. Geo. N. Sieger is at the head of the enterprise.

The proposal to build a civic car line on Bloor Street West, Toronto, from Quebec Avenue to Runnymede Road has passed the Ontario Railway Board and the Board of Control have recommended to the city council that the work be proceeded with without seeking approval of the ratepayers. The cost is approximately \$160,000.

Wingham, Ont.

A hydro enabling by-law was recently passed by the ratepayers of Wingham, Ont. The by-law provides for an expenditure of \$40,000 and was carried by a vote of 320 to 13. The Hydro Commission will start work at once, power to be transmitted from the Eugenia plant.

Winnipeg, Man.

The contract for a sub-station to be erected at Portage la Prairie has been awarded to Tremblay, Denis et Company, of Winnipeg.

The fire and light committee of Winnipeg have recommended an expenditure of \$1,350,000 on the hydro-electric system next year. It is stated that the demand for power has increased 30 per cent. during the past year and indications are that the increase next year will be even greater.

The Southern Canada Power Co. have extended their operations by constructing a line, six miles long, from Cowansville to Dunham, P.Q. This has enabled the latter town to install a system of electric lighting.

In accordance with the new agreement between the city of Sherbrooke, P. Q., and the Sherbrooke Railway & Power Co., the latter are doubling a portion of the tramway lines and extending the system.

The Electrical Appliance Co. have opened a store at 876 St. Catherine St. West, Montreal. Mr. R. H. Mainer and Mr. G. Hill are interested. Mr. Mainer was formerly in business in Winnipeg. The firm are specializing on the Hoover Vacuum cleaner, made by the Hoover Suction Sweeper Co., of Hamilton, the Apex washer, and Beatty Bros. Washer.

For Your Fall Lighting Requirements

We have to offer the famous line of GILL BROS. COMPANY Ornamental Glassware. Send for catalogue and price list. The highest grade glassware made, in plain and decorated finish.

Advertisements for tenders, equipment, wanted or for sale, etc., or miscellaneous, are charged at \$2.50 per inch.

All advertisements must be in the publisher's hands by the 10th or 23rd of the month to insure insertion in the subsequent issue.

WANTED — TECHNICALLY TRAINED MAN with view to taking up designing of electrical apparatus, principally A.C. motors. An opportunity for the right party. Box No. 27, Electrical News, Toronto. 19-22

ARMATURE WINDERS—Give experience, references, and salary required. Scott Bros. Electric Co., Windsor, Ont.; Detroit, Mich. 22

WANTED—A number of first-class armature winders; steady work. Apply The Canadian General Electric Co., Ltd., Peterborough, Ont. 20-21

SALES ELECTRICAL ENGINEER wants to represent electrical supplies manufacturer. Good connection. Both languages. Write "Rena," 102 Maisonneuve St., Quebec City, Canada. 21

ELECTRICIAN AND MECHANIC desires responsible position. Sixteen years experience hydro-electric station operation, maintenance and superintendence. Available after December 1st. Box 47, Electrical News, Toronto. 21-22

For Sale

Thirty used Packard, Type G. Watt Hour Meters, 100 volts, 60 cycles, 5 and 10 Amperes; will pass Government inspection, \$3.00 each. Box 49, Electrical News, Toronto. 21

For Sale

Three lengths No. 20 double rubber covered cable, each 105 ft. long. Listowel Public Utilities Commission. 21-22

Generator For Sale

110 Volts, 30 K.W., 150 horse-power engine, Goldie-McCulloch; matcher, McGregor and Gourlay, 15" head; 12" four sides moulder, Goldie-McCulloch make. All these machines are in good condition and the prices are right. Apply Gold Medal Furniture Mfg. Co., Ltd., Toronto. 21

Transformers

We now have a well-equipped shop for the repair of service transformers up to 50 K.W. capacity.

This is our specialty and we have had considerable experience along these lines.

Instead of discarding burned-out transformers, send them to us for expert repairs. We are prompt and can give satisfaction.

E. J. GROVES,
20-t.f. Box 422, Parry Sound, Ont.

FOR SALE

50 H. P. Motor
Crocker-Wheeler

3 Phase, 25 Cycle, 550 Volts, almost new.

H. V. ANDREWS, 13 Church St., Toronto
20-22

CHIEF ELECTRICIAN, at present in charge of large Mine, including Mills, Construction and Maintenance Departments, desires change. Ontario preferred. Apply Box 45, Electrical News, Toronto. 21

Motors For Sale

We have for sale about 100 D. C. motors, ranging in size from 5 H. P., 1600 r.p.m., to 100 H. P., 430 r.p.m.

These are Canadian General Electric, Chapman & Walker Ltd., and Canadian Westinghouse Company, Ltd. motors.

They will be disposed of under a guarantee of good running condition and prices and terms will be made to suit.

All are offered subject to prior sale.

Itemized list furnished upon request. Write,

Careful in the Goods He Sells

"One thing that we have found," says George J. Beattie, proprietor of the Electric Shop, Toronto, Canada, "is that it pays to sell only a quality device and at the right price, and to stand behind it. Not over a year ago, we sold a device for \$500.00 to a customer. After four months' use, it developed defects and we replaced it with a new unit. As a direct result of this stand-behind-the-goods policy, from this customer direct we have since received about \$1500 additional business, and from a personal friend of his over \$2000—a total of \$3500.

"All dealers should tie-up with goods made by reputable manufacturers backed up by national advertising.

"Our policy is that our interest in the sale does not end when the goods are delivered and paid for, but extends as long as may be necessary. We not only demonstrate an article but we have a trained man who goes around to each customer about once a month to see that the device is operating satisfactorily." —"Contact."

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

"American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$3.00.

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price \$2.00.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price \$2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price \$1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price \$2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price \$2.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Electric Power Transmission, Principles & Calculation, by Alfred Still. 2nd Edition, revised, enlarged and rewritten. Just published by McGraw-Hill Book Co., Inc. 407 pages, illustrated. Price \$3.50.

Elements of The Infinitesimal Calculus, by G. H. Chandler, M.A., Prof. Applied Mathematics, McGill University, 318 pages, cloth bound. Published by John Wiley & Sons, 1907. Price \$1.40.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price \$1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B.S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price \$1.50.

"Elements of Radiotelegraphy," by Ellery W. Stone. Recently published by D. Van Nostrand Company, 267 pages, 125 illustrations, 33 plates. Price \$2.50.

Examples in Alternating Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$2.00.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B.S. Published in 1916. Price \$1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

"Fuel," by C. F. Herington, recently published by D. Van Nostrand Co. 211 pages, with 84 illustrations. Price \$3.00.

"Governors and the Governing of Prime Movers," by W. Trinks. Recently published by D. Van Nostrand Company. 236 pages, 140 illustrations. Price \$3.50.

Handbook of Machine Shop Electricity, by C. E. Clewett. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

Induction Coils in Theory and Practice, by Prof. F. E. Austin. Published this year by the author. 64 pages, illustrated. Price \$1.00.

International Library of Technology, Vol. 11.B, on Electricity and Magnetism, Electrodynamics, Electrical Resist-

ance and Capacity, The Magnetic Circuit, Electromagnetic Induction, Chemistry and Electro-Chemistry, Primary Batteries, Electrical Measurements, 585 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

International Library of Technology, Volume 14-C on Storage Batteries, Incandescent Lighting, Arc Lighting, Interior Wiring, Modern Electric Lighting Devices, Electric Signs, Electric Heating, 540 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

"Powdered Coal as a Fuel," by C. F. Herington, recently published by D. Van Nostrand Co. 211 pages with 84 illustrations. Price \$3.00.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.50.

Standard Wiring, 1919 Edition, 25th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price \$1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price \$2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price \$1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.

The B.I. Hand-Book, published by British Insulated & Helsby Cables, Limited. Second edition. 448 pages, illustrated. Price \$1.00.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price \$2.50.

"The New Competition," by Arthur Jerome Eddy, 6th revised edition, price \$1.60.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price \$1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price \$1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.50.

A Time and Labor Saving Screw for Electrical Contractors

Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

ACQUAINT US WITH YOUR REQUIREMENTS

Eliminate the Waste
of Money on Com-
mutator and Arma-
ture repairs by using
the

"No Spark"

CARBON BRUSHES

A mint of money is wasted every year through the installation and use of brushes of an improper grade. With the correct grade of brush specified the commutator and armature last far longer and repairs are reduced to a minimum.

We will save you a great deal of expense and your engineer much worry by taking the responsibility of selecting the right grade of material. Send for our information sheet to-day.

Write for our latest bulletin.

ECONOMY renewable FUSES

are the *right* fuses to protect *your* electrical circuits—

- because they afford the right sort of protection; their reputation lends assurance that you can safely depend on them for accuracy of rating and all-round efficiency in operation.
- because they cut annual fuse maintenance costs 80% as compared with the use of one-time fuses, owing to the fact that an inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.
- because it's the work of a moment to replace the link and renew the fuse.
- because a good sized stock of "Drop Out" Renewal Links always on hand represents but a small outlay.

ESTABLISHED 1849
BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamilton,
Ont.; London, Ont.; Montreal, Que.; Ottawa,
Ont.; Quebec, Que.; St. John, N.B.; Toronto,
Ont.; Vancouver, B.C.; Victoria, B.C.; Win-
nipeg, Man.; Calgary, Alta.; Edmonton, Alta.;
Sydney, N.S.

THOS. IRVING,
Man. Western Canada, Toronto.

"Pittsburgh" Reflectors

Increase Light
500 per cent.

BY TEST

They are scientifically formed to obtain the maximum of light on the window trim. "Pittsburgh" Reflectors have attained extensive

sales for window lighting, because of their saving of current and their dependability to increase lighting efficiency.

Illustration shows "Pittsburgh" Reflector No. 50 for 100 or 150 Watt Lamp. Dimensions:—Height, 9½ inches; Width, 10 inches. Holder, 2¼ in. Form "O".

Toronto

*Give It
the
Emery
Wheel
Test*

**Spaulding
HARD FIBRE**

Put a sheet, rod or tube of Spaulding Hard Fibre in contact with a revolving emery-wheel. Note how slowly, how finely, how evenly it grinds down. Observe its compact, closely knit, horn-like composition that improves with age and will outlast the machine or product on which it is used.

A Universal Material

Its electric rupture is 200-400 volts per 1/1000 in. of thickness; tensile strength 10,000-20,000 lbs. per square inch; shearing strength 9,000-13,000 lbs. per square inch. It can be machined, sawed, stamped, bent, threaded, drilled and finished in many attractive ways.

Made in red, black and grey colors. Send for samples. Our Specialty Department is equipped to machine special parts to your own specification.

No. 102

Telephone Insulator

Height $2\frac{1}{2}$ inches, diameter $1\frac{1}{2}$ inches with two $\frac{1}{4}$ inch wire grooves.

The galvanized lag screw, which is securely cemented into the insulator, is flattened just below the insulator for engaging a wrench.

Especially adapted for use in mines, and for rural lines, general service lines etc.

Made by

Illinois Electric Porcelain Co.

Phantom View, Walger 2-Way

2-Way Connector

For connections, for lengthening extension wire, and for exchanging fixtures. Save money every time.

Actual Size

Walger Connectors

For faster, more efficient work, and better profits on every job.

Order these handy little time and money savers now. Use them on your next job of interior wiring—then watch the quicker, smoother and more satisfactory work you get.

Walger connectors eliminate blow torch, solder, and all the trouble incurred by using old fashioned methods.

Walger Connectors make permanent connections. They make perfect connections, the kind appreciated

by every Electrical Inspector. Simple to handle, convenient and easy to install. They save time and temper. Approved by the National Board of Fire Underwriters and Hydro Electric Power Commission for No. 12 and smaller wire.

3-Way Connector

To tap feed wires in outlet boxes; Condulets and on knob and cleat work. Guarantee fast, easy connections.

"Just What I Want"

This is exactly what you, or any one else, will say after having bothered around with loose extension cords.

The Automatic Extension Reel

for Electric Lamps

Obviates the necessity of dragging your cord over the floor, thus wearing out insulation and breaking sockets, guards, etc. Takes your light just where you want it, locks at any point, and automatically rewinds your cord when you are through with light. Contains 25 feet of approved reinforced weatherproof cord.

Approved by the Underwriters, and endorsed by fire and electrical bureaus everywhere. Fully protected by two basic patents and more pending. Write for further particulars and prices.

The Cincinnati Specialty Mfg. Co. Inc.

1907-19 Powers St., West, Cincinnati, Ohio

Uni-Lectric Lighting Plants

Farm Lighting Standardized 110 volts Direct Current.

Capacity—1000 watts.

Construction — Best workmanship, simple, accessible, compact.

Regulation—Excellent.

Types — Self Starting (push button control) or Hand Crank.

Advantages — No batteries needed — save charging loss—uses standard code wiring, lamps, motors, and appliances—transmits power over large areas.

Ontario District Agencies Still Open

JOBBER OF ELECTRICAL MERCHANDISE

Westinghouse

Vertical Water-Wheel Generators

A Typical Installation of Two 13,500 Kv-a Vertical Water-Wheel Generators.

The logical answer to the rising cost and uncertain delivery of coal is Hydro-Electric Power.

Westinghouse Water-Wheel Generators, because of their economy and reliability, are giving the most satisfactory service in hydro-electric plants of every description.

They are made in capacities from 30 kv-a up, and with either vertical or horizontal shafts.

Owners of Westinghouse Apparatus are invited to make use of our Service Dept. Repair Shops, where repair work will receive prompt and efficient attention. Repair shops are located at;—

MONTREAL—10 St. Sophie Lane.
TORONTO—16 Temperance St.

WINNIPEG—158 Portage Ave. E.

This **SOLENOID SWITCH** has been adopted
by the Hydro Electric Commission

They use it for
STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment, by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

MONTREAL
St. Nicholas Building

TORONTO
Bank of Hamilton Building

It's interesting

WHEN a large Hydro-Electric Plant installs a 5000 H.P. Silent Chain Drive.

WHEN one of the largest Canadian Manufacturing Plants install over 27 Silent Chain Drives totalling over 4000 H.P.

WHEN a large Canadian City installs a 500 H.P. Silent Chain for driving Generators to provide light for the City.

WHEN a large percentage of our orders are repeat orders.

WHEN practically every Pulp and Paper Mill, Steel Mill, Mine, Grain Elevator, and a very large proportion of the Manufacturers in Canada are Users of either "Renold" or "Morse" Silent Driving Chains.

Well, you can't help sitting up and taking notice. Can you?

DURADUCT

Northern Electric Company
LIMITED

- that's all

FOR PROTECTION USE

Oil Switches and Circuit Breakers

TYPE D-13

Maximum Amperes, 800

Maximum Volts, 27,000

MANUALLY OPERATED—REMOTE CONTROL
27,000 Volts—300 Amperes

APPLICATION

D-13 oil switches and circuit breakers are used for controlling and protecting generators, feeder circuits, transformer banks, etc. Their sturdy construction, high factor of insulation, and ability to interrupt large amounts of energy makes them highly desirable for controlling and protecting apparatus and circuits, where uninterrupted service is of extreme importance.

CONDIT D-13 oil switches and circuit breakers are made in single, two, three and four poles for manual remote control or electrical operation. They are furnished in 300, 500 and 800 ampere capacity for pressures of 15,000 volts or less, for capacities of 300 and 500 amperes where the pressure does not exceed 25,000, and for capacity of 300 amperes at 27,000 volts. The D-13 oil switch and circuit breaker is adapted for flat surface mounting on either wall or in cells, or it may be mounted on pipe frame structures. The design of the switch structure and operating mechanism is such as to afford the usual mounting arrangements met with in standard practice.

CONSTRUCTION

The face plates are neat and well finished. The handles are substantial and of good appearance, and are so arranged that they drop automatically to the open position when the circuit breaker opens, thus affording visual indication of the position of the movable contact members within the tank.

All automatic forms may be provided with undervoltage, shunt trip and time-limit attachments. Auxiliary switches of the circuit opening or circuit closing type may also be utilized in connection with either the non-automatic or automatic form.

All automatic type D-13 overload circuit breakers have their trip coils and calibration adjustments on the front of the switch-

board, and the mechanism is arranged to prevent the operator from holding the switch closed during an overload or short circuit.

Some of the important features which characterize CONDIT D-13 oil switches and circuit breakers are the efficient laminated brush, the reversible and easily renewable auxiliary arcing tips, the self-aligning, sure-seating action between the movable contact members and the stationary contact members, the rugged "tank per pole" construction, high head of oil over break, large expansion chamber and the strong spring action inherent in the CONDIT brushes, which facilitates rapid acceleration of the movable contact members on the initial opening of the circuit.

"National Protection"

**RUST PROOF—ACID PROOF**

A SHERARDIZED surface absolutely protects against rust. By the sherardizing process, the zinc is not merely applied as an enamel to the surface, but is *alloyed with the steel* and becomes a part of it. And more than that, the interior surface is given the same superior zinc protective treatment as the exterior.

A clear acid and alkali proof enamel is then baked on the Sherarduct and affords the best protection to the underlying surfaces against the destructive action of gases and acids. This enamel coating is also applied to the interior surface.

Both surfaces of Sherarduct are sherardized and enameled. "National" Protection is Double Protection. *Write for Descriptive Bulletin No. 50.*

Are Yours the Safest POTHEADS

YOU use potheads for safety at the cable end. Are you sure you have the SAFEST potheads? Do you KNOW what makes them so?

"Franklin" Cable Potheads are different from other kinds in a way so ingenious and important that basic patents have been granted. This difference is an added feature of security that makes this pothead not only perfect in protection, but also fool-proof in its application.

The Franklin Pothead has two clamping members that in attaching, automatically bell out the lead sheathing and provide a gradually diverging static shield, an air-tight, waterproof and solderless joint and an absolutely uniform distribution of all static strains. The pothead body and cover may be all-porcelain, composition or metal, depending on the type. It is simple and easy to install. It is less expensive.

Since Potheads are purchased for security alone—buy the best, the safest Pothead—Buy the "Franklin." Order some and see. Write for full data on this and other "Franklin" Generating Station equipment.

Measurement of Maximum Demand

WITH the exception perhaps, of the very large customers on your lines, you are guessing at maximum demand.

In the old days you guessed at the Kilo Watt consumption, calling it a flat rate system. When flat rate towns installed integrating watt-meters for the first time, their revenue jumped. If you measure the other part of the bills, namely Maximum Demand, instead of guessing at it, your revenue will jump. This helps your Profits, or in case of service at cost enables you to reduce your rates, which in time attracts industries to your town and makes it grow. Do not forget your job grows too.

Get in touch with the Lincoln Meter for information about the New Canadian Development.

LINCOLN METER CO. LTD.

243 College Street, TORONTO, Canada

Telegraphic Address: "Meters," Toronto.

STOP! LOOK! LISTEN!

Stop

to consider Mr. Manager, what it means to have meters which will give the maximum amount of accuracy on minimum current. Why not eliminate that old trouble of having meters which will not register on small loads. The C & H kind are efficient on all loads.

Listen

for that usual complaint this month from those exacting customers of yours. "They did not use that much current" etc., etc. Then investigate their complaint. Then put them in a C & H Meter.

The Reputation is behind it. Our business is built up by satisfied customers and a courteous service.

Ask for Technical Information. It's free.

LOOK at the features embodied in the construction of the C & H Meter. Simplicity, Accuracy and Reliability are the keynotes throughout.

Chamberlain & Hookham Meter Co., Limited

61 Albert Street, WINNIPEG

A Time and Labor Saving Screw for Electrical Contractors

Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Accurate—Rugged—Inexpensive

In factory or field, the Type S set will quickly and accurately measure resistance or locate faults. It will withstand, without detriment to its electrical qualities, the knocks which such a set is bound to get. It is of the Dial Decade Type, and therefore simple to operate.

Excellent design plus quantity production enables a low price without sacrificing accuracy—ratio coils 1/20 per cent, rheostat coils 1/10 per cent guaranteed.

The removable suspended coil galvanometer deflects a millimeter per microampere. This combination—accuracy of adjustment of coils, sensitivity of indicator, ruggedness, inexpensive-ness—is found only in the Type S set.

PRICE \$75.00

Make the Most of Your Christmas Trade

So widespread is the use of electrical power, and so varied and useful its application in the modern house, that the electrical appliance makes the most desirable of Christmas presents.

What could be more acceptable than one of the many modern electrical accessories that do so much to lighten the task of housekeeping or of providing some convenience, comfort, or thing of beauty. In

C.G.E. ELECTRICAL DEVICES

there is a most comprehensive range of appliances that make the modern home happier, brighter, and better for the use of electric current. All ideal Christmas gifts that will mean satisfaction to your customer, and profit to you, as well as give you a claim on future patronage.

This should be the electrical dealers' Christmas for volume of trade, and in anticipation of the demand for C. G. E. ap-

pliances we have made special arrangements to meet all your Christmas requirements.

The thing is for you to get your orders in early. Don't delay. It will give us a better opportunity of filling your orders promptly, and place you in a much better position to cope with your Christmas trade, and so secure your full share of this profitable business.

The Key to Bigger Business

It is logical to suppose that a successful article with a coast-to-coast reputation for genuine service to the public is going to bring selling success to those handling it.

Edison Mazda Tungsten Lamps

have achieved such wide popularity all over Canada that successful merchandising has invariably been the result with the electrical dealer who has offered them to his customer.

The old adage of "Well Bought is Half Sold" has never been better illustrated than in the big business turned over by dealers with the Edison Mazda Lamp.

Every help is afforded the Edison Mazda dealer in attracting trade. Local advertising, literature, and window displays are at your service.

If you are not handling the Edison Mazda Lamp, write for particulars of our service to you and your customers.

REDMANOL

Perfect Moulded Insulation

for example :

Wave-length Changers

Part of every wireless equipment is a wave-length changer for tuning wave lengths. During the war United States Navy Radio Outfits were equipped with wave-length changers made of Redmanol. This is but one of many uses to which Redmanol is put because of its sturdy, serviceable and reliable qualities.

Our laboratory is anxious to solve manufacturers' problems. Ask us.

Redmanol Qualities

Resistance to extreme heat.
Exceptionally high dielectric strength.

Great mechanical strength.
Excellent acid resistance.
Unusual accuracy of dimensions.

Singular beauty of finish.

O-B Base—Form 1

Simplified Maintenance Puts Years of Service in O-B Trolley Base

Like every good device, the O-B Trolley Base requires a certain amount of care. And proper care is so easy that it is sure to get what attention it needs.

Lubrication, for instance, is a simple matter. Hook down the fork, back off a machine screw, pull out a retaining clip and one man lifts the base off its stem without removing the pole, even in the car barn, where headroom is minus.

There's the whole works open for easy inspection and lubrication. The roller bearings are caged so they stand where they belong. Incidentally, caged rollers never jam in service.

Renewable steel bushings absorb most of the wear. It takes only a few minutes to make the O-B Base like new.

This easy maintenance idea, coupled with balanced, rugged construction, puts years of thoroughly satisfactory life in the O-B Base.

Try one on your own cars at our expense.

The Ohio Brass Company

MANSFIELD, OHIO

Dark parts are renewable bushings

PRODUCTS

Quality First

O-B Type A Trolley Ear

O-B TROLLEY EARS LIPS RIGHT—METAL RIGHT—LONG LIFE

Lips are the business part of an ear.

O-B Ears are cast solid and the groove milled out. Only in this way can the metal in the lips always be of good quality.

Milling the groove produces lips of uniform thickness which is impossible with cored grooves, because the core shifts.

O-B Ears have lips of maximum thickness and yet the underrun is smooth, every time.

Ears are automatically centered on this machine, which mills the grooves.

Scientific supervision of processes keeps O-B Bronze at the highest standard.

The formula adopted by the A.E.R.A. is used and **followed exactly**.

Good metal and the solid casting method which retains the full value of the metal coupled with **right** design puts exceptionally long life in every O-B Ear.

A Profitable Stock Item for Jobbers and Dealers

There is a continuous demand in factories and machine shops for grinding outfits, and the grinding motor is one of the items the jobber and dealer can stock with assurance of prompt turn-over.

The polyphase alternating current outfit illustrated is one for which there is an especially large and growing demand. This outfit consists of a dust-proof, 1 H.P. ball bearing motor, wound for two or three phase motor, wound for two or three phase circuits. It is equipped with substantial wheel guards with tool rests at each end, and the shaft is fitted with flanges and nuts for attaching the wheels.

The guards are so constructed that the top halves may be thrown back, giving access to the entire top halves of the wheels when grinding large pieces of work. The tool rests have wide faces and as the wheels wear down and the rests are moved forward no open space is left between the rests and wheel guards. This prevents small pieces from dropping down into the wheel guards, as often

happens when narrow tool rests are used with wheels which have been worn to small diameters.

The guards are of substantial construction and will admit wheels of ten-inch diameter and one inch face, which is the maximum size the motor is rated to carry.

In addition to the outfit illustrated, the R & M line also includes direct current outfits in $\frac{1}{2}$ and $\frac{1}{4}$ horsepower sizes, also alternating current, single-phase and direct current dental lathe motors.

Descriptive literature and prices on any of these outfits will be furnished on request.

Vol. 23

Toronto, November 15, 1919

No. 22

The Problem To-day is "More Sales"— How Much is Your Window Worth?

Our readers will have noted the announcement of the "Best Window" contest in our November issue. The announcement is repeated in the present number. The underlying idea in making this offer is that well-dressed windows are the most effective means at the disposal of the retailer in attracting the attention of the buyer and bringing him into the store.

We realize, however, that it is not the easiest thing in the world to get a good photograph even after you have made up your window and we are printing the following suggestions in the hope that they may be found useful. Of course it is the photo of the exterior that causes the most trouble.

Points to Remember in Photographing Windows

Take the picture at night. Have all lamps except those lighting the window put out while taking the picture.

Have the window well lighted. Replace temporarily all 25-watt and 50-watt lamps used in the top of the window with 75-watt and 100-watt Mazda C or Mazda C-2 (Daylight) lamps. Mazda C lamps give whiter light than Mazda B lamps and therefore have a stronger effect on the photographic plate. Mazda Daylight lamps are better than Mazda C lamps for photographic purposes.

If reflection from street lights or from windows across the street appear in the window glass, arrange to have such lights put out or shielded while the picture is taken.

See that no glare from lamps in the window enters the lens of the camera. Glaring lights cause large rings or "ghosts."

Never use flash-light; it shows in the picture.

Use portrait film for the picture if possible.

Set the camera solid and level in front of the window.

If the window is well lighted the average camera should be stopped down to at least 32 to get a sharp, clear picture.

The smaller the stop used the longer the exposure necessary. Usually an exposure of at least 15 minutes is required.

Make the print on glossy paper.

Commission of Conservation Issues Further Valuable Water Power Data.

The commission of Conservation of Canada have given further evidence of the splendid value of their work to the Canadian people, in their latest report—Water Powers of British Columbia. It has been generally known that this work was under way for some years but the war, of course, delayed it materially. Now that the report is published, however, it will come as a surprise to all that the Commission has been able to gather together, even over a period of several years, such a mass of interesting and educative information. The report is the work of Mr. Arthur V. White, consulting engineer to the Commission of Conservation, assisted by Mr. Charles J. Vick. The collection of data has been under the personal charge of Mr. White, who has necessarily spent much time in the Pacific Province.

There are not, it is true, any very startling figures in the report regarding British Columbia's water powers, the whole volume giving one the impression, however, that it is a tribute to Mr. White's "infinite capacity for taking pains." The field is covered completely—power, irrigation, navigation, fisheries, mining and other industrial purposes—with a thoroughness that leaves nothing to be added. When we say nothing "startling" we simply mean that the fact of 3,000,000 h.p. being available in this province occasions little surprise to a people accustomed to such heritages as Niagara Falls, the St. Lawrence River, the St. Maurice, the Nelson and others scarcely less important. It is evident, however, that British Columbia, though she cannot boast a Niagara, has ample power for some time to come, for, of the above mentioned total only about 250,000 h.p., or 8 1/3 per cent. has been developed. It is satisfactory to note, too, that a goodly proportion of the total lies within the railway belt, for, with the increasing price of coal and the uncertainties attending its production and distribution, there is certain to be an early movement towards trunk line electrification.

It is worthy of note that Mr. White has not been unmindful of the comfort and convenience of his readers. The text is logically arranged; the photographs are well chosen and excellently reproduced; the type is a good size and clear cut; it is noticeable also that Mr. White has kept in mind the necessity for thrift and economy, for there is a conspicuous absence of the lavish display of unused space so frequently seen in similar reports.

Altogether the report must be considered as a valuable addition to the sum total of our knowledge of the national resources of Canada and of their practical utility, and is one of which the Commission of Conservation may well feel very proud. In other pages of this issue a fairly comprehensive resume is given of the various chapters. For those who can spare the time, however, a careful study of the report itself will amply repay the reader for whatever expenditure of time and energy he may make.

Montreal Electrical Luncheon Club

At the Montreal Electrical Luncheon on November 5, Messrs. W. B. Shaw, of the Montreal Electrical Co., E. W. Sayer, of the Sayer Electric Co., and J. W. Pilcher, of the Canadian General Electric Co. were the speakers. The talks consisted of reminiscences, chiefly of the early days of electricity in Montreal, and also of amusing incidents arising out of their business experiences. Mr. Shaw recalled the early days of the Maxim and Royal Companies, and of the difficulties met with and overcome by Mr. Fred Thomson. In those days the Royal Company had to make everything in the way of electrical fixtures, and there were also great difficulties in wiring. Mr. Pilcher said that the difficulties to-day were very insignificant as compared with those of, say, 30 years ago. As the oldest salesman in the electrical business in Canada, he appreciated the improvements that were now in existence. The Entertainments Committee were asked to consider the advisability of holding a smoking concert.

The Electric Club of Toronto

A number of prominent speakers have addressed The Electric Club of Toronto during the recent past. On October 24, Mr. Herbert Dennison, well-known patent attorney, spoke on Patents. On October 31, Major Drew of the Soldiers Civil Re-establishment Department outlined the work being done in the way of educating and establishing returned men. He was accompanied by Mr. Young, Mr. Fletcher and Major Epps, each of whom spoke briefly on his special department of the work—Mr. Young on "Interviewing," Mr. Fletcher on "Industrial Survey" and Major Epps on "After Care."

Mr. W. A. McLean, Deputy Minister of Highways of the Province of Ontario, on Nov. 7, gave the members a brief outline of the work being done by his department. He stated some interesting facts regarding the economies that have been effected by farmers and others through the use of motor transportation, only made possible by good roads. Mr. McLean emphasized the point that neither first cost nor cost of maintenance of roadways and motor trucks must be allowed to overshadow the advantages gained in time and efficiency.

Mr. Paul M. Lincoln, past president American Institute Electrical Engineers, will be the speaker on Nov. 14. His subject will be "Electrification of Railways."

Acoustical Engineering

Acoustical engineering, as one of the developments of the immediate future which must play an important part in speeding up production and insuring American dominance in world trade was discussed before a joint meeting of the Cleveland Engineering Club and Electrical League of Cleveland, Thursday, at Hotel Statler, by Prof. Vladimir Karapetoff, head of the electrical engineering department of Cornell University. His address was featured by a practical demonstration of the results of an extensive investigation of audible and visible electric signals in industrial plants of different kinds and under varying conditions during the last year. The object of this research was the solution of the problem of taking up lost motion and frequently excessive time loss in factories of the more important sort in quickly locating departmental heads for conference requirements. He used in this illustration a klaxocator, an electrical code calling mechanism of the audible type. The appliance is entirely automatic in operation, once set by the operator. While the subject is one of constantly increasing interest to engineers it is primarily of vital importance to the manufacturer. With the growing demand for rapid-fire

production, and the possibility of a shortening of the hours of labor in many lines, a more effective system of keeping in instant touch with every department and every departmental production head becomes more and more imperative. Prof. Karapetoff declares that big industrial plants in future must make this precautionary provision and that acoustical engineering will become one of the important sciences of industrial construction.

Lethbridge Adds 1563 kv.a. Turbo-generator

The Corporation of Lethbridge have recently installed in their power house another turbo-generator set of 1563 kv.a. capacity, 3600 R.P.M., 2300 volt, two phase. The set is arranged for condensing operation and runs in parallel with a 1500 kv.a. turbine and 580 kv.a. and 350 kv.a. engine-driven generators. The new turbo-generator is excited from d.c. busses, to which are connected a 50 kw. engine-driven exciter and a 30 kw. motor driven exciter. The turbine is of the impulse type with wheel casing split horizontally, the steam inlet and exhaust being in the lower half of the casing. The turbine and generator are connected by rugged tie pieces carrying the oil reservoir and pump. This arrangement is particularly adapted to allow free and uniform expansion, thus insuring accurate alignment. The turbine is operated at 150 lbs. steam pressure at the throttle and 90 degrees Fahrenheit superheat, with not more than two inches back pressure in the exhaust chamber of the turbine.

The condenser is of the Wheeler improved surface type

1563 kv.a., 3600 r.p.m., 2300 v. Curtis turbo-generator set, Lethbridge, Alta.

with seamless brass tubes, with the Hotwell chamber bolted under the condenser shell. Radio-Jet air pumps and a ten-inch circulating pump of the centrifugal type have been installed. The usual accessories, including copper expansion joint, exhaust valve, relief valve and Cochrane steam separator make up the complete equipment for this unit.

The whole equipment was supplied by and installed under the supervision of the Canadian General Electric Company of Toronto.—G. N. T.

You Have an Appointment on Tuesday Evening, November 25

Mr. J. M. Wakeman, general manager Society for Electrical Development, will be in Toronto on Monday and Tuesday, November 24 and 25. A general meeting of electrical men is being planned for Tuesday evening, probably at the King Edward Hotel, when Mr. Wakeman will give an address. More complete details will be announced later.

Montreal illumination for Prince of Wales' visit—C. P. R. Windsor Station

Windsor Station Illumination for the Prince

From the electrical point of view, the most effective and extensive scheme of decoration in Montreal during the visit of the Prince of Wales was at the Windsor Station of the C.P.R. The plan was designed by Mr. J. W. Bell, the superintendent of the building, and carried out by the Denis Advertising Signs Ltd. The work took six weeks to complete, and in order to wire the building and instal the lamps, it was necessary to use tackle, chairs and boats to reach the more inaccessible places.

The wiring used on three sides of the depot measured $1\frac{1}{4}$ miles and the lamps numbered 7,700. There were three main leads, three wire system, the power being supplied by the Montreal Light, Heat and Power Consolidated. In the Prince of Wales Feathers, which were 13 ft. in height, there were 242 lights, and two maple leaves, each 12 feet high, contained 145 lights; while there were 55 lights in each of the four illuminated crowns. The lights were of 10 watts capacity. Four flood lights, each 1,000 watts, were employed to illuminate a large flag on the top of the tower. Besides the electrical decoration, there was a large display of flags, streamers and shields.

British Columbia Technical Association

The British Columbia Technical Association held its first banquet towards the end of October in the University Club, Vancouver. Due to the increased interest taken in the organization by all classes of technical men the executive planned to combine the business meeting with a social function and success attended the first effort in this connection. About a hundred representatives of civil, electrical, mechanical and mining engineering were present. Mr. E. G. Matheson, professor of civil engineering in the University of Brit-

ish Columbia, presided and, in the course of an interesting address, outlined the important functions which it had fallen to the lot of technically-trained men to perform in the modern world.

The development of industry and of the resources of the country was in a great measure, said the speaker, dependent on the work of technical men engaged in engineering and allied professions. Engineering and scientific development entered into matters affecting the daily life of every civilized community to a degree which was not always appreciated.

It was part of the aim of the association to cultivate a greater measure of public recognition and improved status as applied to the work of qualified technical men, to establish some more definite basis for computing the value of technical service and also to further the interests of the community at large encouraging the employment of properly qualified men where work of an important engineering or technical nature had to be performed.

Prof. Matheson sketched the activities of the association and pointed out that, although the organization was only about eight months old, the membership was already 250, and a total of 300 was expected by the end of this year.

Following the banquet, business was transacted and this was followed by a musical programme. The secretary-treasurer of the association is Mr. R. Snodgrass, 812 Board of Trade Building, Vancouver, B. C.

It is stated that in recent tests at Erie, Pa., of a new gearless passenger locomotive, developed at the works of the General Electric Company, the electric locomotive succeeded quite easily in defeating two steam locomotives in a tug-of-war.

The Booth-Hall Electric Furnace

By W. K. Booth*

The principal difference between the various makes of electric furnaces is the method in which the power is introduced in the furnace. The general metallurgical operations of practically all electric arc furnaces are the same. The method of power regulation and bringing the power to the furnace frequently means greater or less cost in furnace operation and governs, to a considerable extent, the manner in which the furnace lining may be put in and consequently the refractory cost and the loss of time due to furnace shut-downs.

Electric arc furnaces may be broadly divided into two classes:—

- (1) Vertical arc furnaces,
 - (a) conducting hearth,
 - (b) non-conducting hearth;
- (2) Horizontal arc furnaces.

It is not the purpose, here, to enter into a discussion of the merits of the various types of arc furnaces, but more particularly to describe a new type of electric furnace which has been developed during the last year and which is known as the Booth-Hall electric furnace.

The Booth-Hall electric furnace comes under class 1 (a) above, and is illustrated diagrammatically in Figs. 1 to 4.

Fig. 1 is a longitudinal section of the two-phase electric furnace with the auxiliary electrode resting upon the charge and arcs drawn between the main electrodes and the charge. A pool of metal is shown forming on the hearth of the furnace.

Fig. 2 is a diagram of a transverse section of the two-phase electric furnace, showing the crossing action of the currents in the bath and the grids embedded in the hearth.

Fig. 3 is a diagrammatic representation of the electrical connections for the two-phase electric furnace employing two single-phase Scott-connected transformers. This diagram shows the connections from the transformer terminals to the main electrodes and to the auxiliary electrode and grids. A two-phase electric furnace so connected gives a balanced load on a three-phase power service. The auxiliary electrode is shown in black.

Fig. 4 shows diagrammatically the arrangement of main and auxiliary electrodes in single, two, and three-phase Booth-Hall furnaces. The auxiliary electrodes are shown in black.

The furnace is built either single, two, or three-phase to suit the conditions at the place of installation, the general principle being a furnace having a solid hearth which becomes conductive of electricity when hot, and the use of an auxiliary electrode which acts as a return for the electric current until the hearth becomes heated and conductive.

In starting furnace operation on a cold charge the auxiliary electrode is lowered until it rests on top of the charge, and the arc is then drawn between the charge and the main electrodes or electrode, as the case may be, the auxiliary acting as a return for the main electrode or electrodes. The auxiliary is so arranged that it presses with its entire weight on top of the charge and consequently no arc can form underneath the auxiliary; experience has demonstrated that no arc does form. The auxiliary is connected in parallel with the conducting hearth, and when the main electrodes or electrode have melted enough metal to form a pool on the bottom, the hearth becomes conductive and the

auxiliary is withdrawn from contact with the charge. In a cold furnace the auxiliary is in operation from 30 to 45 minutes, and, in a furnace which is hot, less than 15 minutes; that is, only long enough to assure a positive start of the furnace and a balanced load on the power company's line.

Furnaces from $\frac{1}{2}$ ton to 6 tons' holding capacity are generally built for two-phase operation, taking power from three-phase service by means of Scott-connected transformers, as shown diagrammatically in Fig. 3. In the hearth of the Booth-Hall two-phase electric furnace two sets of grids are embedded, which are electrically insulated from each other and are so related to the main electrodes that the current of the two phases cross in the bath, thus giving a maximum of circulation of the molten metal and causing, in conjunction with the effect of the bottom heating, a very thorough mixing of the metal in the bath. This action can readily be observed on looking into the furnace after the charge has entirely melted. The conducting grids are placed as far as possible from the heated interior of the furnace, and experience has shown that they never become overheated or require special cooling. The grids are so constructed as to handle large currents, furnishing large areas

FIG. 1.—Booth-Hall two-phase furnace

of contact with the material of the conducting bottom, and preventing local heating due to contact resistance.

By the use of the auxiliary electrode a positive start of the furnace is guaranteed, and there is no possibility of failure to secure contact. Each main electrode is independent of the other, as there are no arcs in series, and consequently the regulation of the furnace is very simple, giving a balanced polyphase load on the power service lines. As with the two-phase connection there are only two electrodes to regulate, this offers the minimum number of electrodes for a balanced polyphase load, and the smaller the number of

* Before Institution of Electrical Engineers.

electrodes requiring regulation the smoother becomes the furnace operation.

The hearth is either acid or basic, as desired, and in each case is at least 24 inches (60 cm.) in thickness, being sintered in place layer by layer and forming a monolithic mass. By using the main electrodes in conjunction with the auxiliary, the materials of the hearth are sintered together in thin layers similar to open-hearth practice, thus forming a very durable bottom and making the danger of run-outs a minimum. The furnace hearth is consequently solid, with no water cooling of any kind. With the basic hearth, dead burned dolomite is used to maintain the slag line; in the acid furnace, ground ganister is used for the same purpose. The conducting hearth gives a uniform bottom heating of the entire bath, prevents sculls, and makes speedier and more thorough distribution of the heavier alloys, which tend to sink to the bottom of the bath. The effect of this bottom heating is considerable, and has been accurately measured on Booth-Hall furnaces in continuous operation.

With the two-phase electric furnace a minimum of electrode consumption is secured, due to the fact that a minimum number of electrodes for a balanced polyphase load is used. This means fewer electrodes to handle, less electrode breakage, and less surface burning. The loss on the auxiliary electrode is small, because it is in operation for such a comparatively short time. The electrode jaws are

FIG. 2.—Booth-Hall two-phase furnace.

made so that the electrodes can be gripped or released by turning a handwheel or lever at the side of the furnace and it is not therefore necessary for the melter to climb on top of his furnace when changing the grip on the electrodes. The electrode jaws are arranged in segments so as to take up and adjust themselves to the inaccuracies in the surface of the electrodes.

A roomy charging door of special construction is provided in the rear of the furnace and another door in front over the tap. This construction is very similar to the open hearth and permits a battery of furnaces to be arranged side by side and a charging machine to serve them all. The furnace tilts or rocks backward as well as forward, and slagging operations can be handled from either the rear or the front as desired. The door is designed so that it comes flush against the door frame, sealing the opening, and cannot swing open of its own accord. This prevents air getting into the furnace and also prevents excessive losses of heat through the door. The door can be opened

anywhere from a few inches to full open when inspecting the bath, taking tests, or pushing scrap from the sides of the furnace into the bath, thus protecting the melter from the heat of the furnace and preventing great radiation loss. Any warping of the door or frame does not affect the operation of the door or its sealing of the opening when closed.

The furnace is motor tilted, in all sizes, for pouring, but is arranged so that it can be tilted by hand in emergency if the motor fails to operate. The smaller sizes of furnace are built for hand operation only, if desired. All parts of the tilting mechanism, including gears and motors, are arranged so that they do not come beneath the furnace and there-

FIG. 3.—Electrical connections of Booth-Hall two-phase furnace.

fore there is nothing under the furnace than can be injured in case of a run-out.

The main electrodes are arranged for automatic regulation and also, in every case, so that they can be regulated by hand in case the regulators or motors should require repair.

The importance of power control is universally recognized, especially when refining operations are carried on. In the Booth-Hall electric furnace the power input can be maintained at any point from one-fourth to full load by means of proper voltage reduction and control switches.

Fig. 4—Diagrammatic representation of electrode arrangement

In making steel for the ordinary grade of steel castings, the Booth-Hall electric furnace has operated with a power consumption as low as 446 kilowatt-hours per 2,000 lb. (906 kg.) of steel poured, but the average will be between 500 and 550 kilowatt-hours per net ton for continuous operation. In one of the 4-ton furnaces a considerable quantity of low phosphorous pig iron has been made running over 0.035 per cent. in phosphorous and sulphur, also special steels requiring refining with two or more slags. The power consumption, of course, depending upon the degree of refining required.

Water Power Resources of British Columbia

Comprehensive Report Issued by the Commission of Conservation of Canada
— Coast Province Boasts 3,000,000 Horse Power

"Water Powers of British Columbia" is the title of a report upon this subject just published by the Commission of Conservation, under the authorship of its consulting engineer, Mr. Arthur V. White. The report is a very complete compendium of data relating to the water-power resources of British Columbia. Commenting broadly upon the report, we would say that it may be divided into four main sections. First of all, in Chapters I to VI, there is a statement of the guiding principles which should govern the conservation and utilization of inland waters, and a description of certain important features which should characterize reliable water-power data. These chapters also include a comprehensive historical survey of water legislation in the Province, together with discussions of subjects cognate there, such as the procedure to obtain water rights; electrical inspection; and the exportation of electrical energy.

The second main section, comprising Chapters VII to XIV, deals with the physical characteristics of British Columbia—its topographic and climatic features as they relate to the development of water power. A description is also given of the chief provincial developed and undeveloped powers, and there is included a very useful chapter dealing with surveys and maps of British Columbia. In connection with the topographic descriptions and power-site tables, the Province has been conveniently divided into five districts, corresponding to the main drainage areas, namely, the Columbia River and tributaries, Fraser River and tributaries, Vancouver Island, Mainland Pacific Coast, and the Mackenzie River tributaries.

The third main section of the report, comprising Chapters XV to XVIII, inclusive, presents in very compact form digests of stream-flow, meteorological and other hydrometric records.

What may be termed the fourth section, includes the appendices containing hydraulic conversion tables and convenient equivalents, a list of bench marks, and a comprehensive and classified bibliography. It may be remarked that, owing to the pains taken in the compilation of this bibliography of over 200 items relating particularly to British Columbia, one has here a ready guide to the literature relating to the history and natural resources of the Province. Classification is made under broad subject headings, as follows:

- I. General reference works.
- II. Guides, handbooks and other publications, giving descriptive information and historical data relating to various natural resources of the Province.
- III. Topography—Government and other publications containing descriptions of the physical characteristics of various watersheds.
- IV. Travel and Exploration—Mountaineering and other sport.
- V. Histories and works of historical interest, including North West Coast Voyages, Hudson's Bay Company Affairs, International Waters, Boundaries, Treaties.

The report concludes with an unusually full index—a feature too often "sidestepped."

The Report in Detail

Too frequently in reports on water-power resources it has been the tendency to deal with power developed exclusively, without adequately considering such related subjects as domestic and municipal supply, agriculture and irrigation, navigation, fisheries and riparian rights. In this report, however, the author, although dealing with water-power resources, has recognized the fact that water power is but one of the important uses to which inland waters may be applied. This aspect of the subject is discussed in Chapter I, in which reference is also made to the paucity of information available, respecting British Columbia water powers at the time the Commission of Conservation, with the co-operation of the Provincial Government, undertook this work. The comprehensiveness of the report's outlook upon the water-power situation, as above indicated, may well be understood from a consideration of some of the sub-headings of this chapter, which deal with such subjects as: "Run-off and Forests;" "Water-Power and Agriculture," including a special reference to the necessity of conserving the underground waters; "Water-Power and Irrigation," where, it is pointed out, that irrigation tends to the permanent settlement of the country, and that consequently, in the majority of cases, the use of water for irrigation will result in more widespread benefit than if otherwise used; "Water-Power and Navigation," where it is pointed out that power possibilities, under certain circumstances, are frequently regarded as of less, or as of only incidental, value, when compared with the interests of navigation. A list is here given of the navigable inland waters of British Columbia.

Under "Water Power and Fisheries" the serious consequences to the fishing resources resulting from obstructions which prevent the free passage of salmon and other fish is referred to as being vital in its bearing upon power development. The author points out that no development for power or irrigation should be permitted on any of the salmon streams without fully safeguarding the fishing industry. Under "Inland Waters and Mining," it is emphasized that the mining industry in British Columbia has exerted a marked influence upon the laws relating to the use of water-power and water, a fact to be expected on account of the important part which water and water-power have played in mining development. The important subject of the "Pollution of Inland Waters," is dealt with at some length, and reference is made to the pollution by factory and industrial wastes, including the serious damage occasioned by accumulation in streams of logging waste and other wood debris, such debris constituting a serious menace to bridges, public highways, water-power development, etc. As is well known, "Inland Waters Attract Tourists," and under this heading it is pointed out that where care is exercised to conserve scenic and sporting assets, such constitute an attraction for tourists, often a means of bringing much revenue into the country. Reference is also made to the important international character of some of British Columbia's streams and lakes.

Water Power Data

Chapter II of the report is devoted to a clear-cut discussion of water-power data. Consequent upon the great

advance in the industrial arts which took place with the employment of steam, and which has been tremendously accentuated by the employment of electricity, there has been greatly increased demand for power, with the result that in recent years there has been a great stock-taking of water-power assets, especially by governmental agencies. It is emphasized that an accurate knowledge of the physical characteristics of various watersheds and of the basic physical factors will alone enable a proper estimate to be made of the potentialities of proposed developments. The effort required to secure these results takes time, and without such information a prospective investor is not in a position to form a sound independent judgment respecting some of the basic factors involved in any project that may be under consideration.

Naturally, water powers more easily developed, with good storage available and situated near centres of population, have the greatest value. The author points out that

The Province of British Columbia has encountered exceptional difficulties in connection with the uses and administration of its inland waters. Indeed, no province of the Dominion has had such difficult problems to contend with. The chapter dealing with the provincial water laws gives an historical survey of water legislation in British Columbia, which is most interesting, even for those who have not the 'legal mind.' Commencing in 1858 with the revocation of the Royal License of exclusive trade issued to the Hudson's Bay Company, the author deals analytically with the various proclamations, regulations and acts, comprising over eighty separate enactments, down to the legislation now in force. Commencing with early colonial days, we note the provincial water legislation taking form in connection with early mining activities along the Fraser River and in the Cariboo district. There was little either in the common law of England, or in the statutes of older commonwealths which could adequately serve as a precedent for the solution of many of the problems peculiarly associated with the use of waters in British Columbia. The earliest regulations disclose the application of the principle which has been maintained throughout the whole

Left—Helmoken Fall, near mouth; sheer fall of 450 feet
Right—Elk Fall, Campbell River, Vancouver Island

it is as necessary to differentiate between water powers as it is to differentiate in the case of agricultural lands, timber tracts, fisheries or any other natural resources varying in quantity, quality and situation. Examples are given to show how neglect to assemble rightly or to properly interpret essential physical data has been responsible for many serious financial and other failures.

This chapter is replete with good counsel fortified by apt illustration, all presented with a view to protecting the investor against loss through embarking upon projects without making the proper preliminary investigations. A word is added counselling that the Government should make provision for flowage easement along the shores of lakes and rivers in order to prevent the erection of buildings and the carrying out of other permanent improvements on low-lying lands bordering lakes and streams; the contention being that it is generally cheaper to make such reservations than it is to settle claims for damages through flooding.

of the legislation, which principle really constitutes the chief strength of the law. It has been termed the "Doctrine of Beneficial Use." Briefly enunciated, it simply means that any rights or privileges granted to a water user are forfeited if he fails to continue to apply the water allotted to him to beneficial use; the idea being that if the user does not employ the water beneficially, then he must step aside and allow someone else the opportunity of doing so. No one party is permitted to usurp rights to the exclusion of the rights of others. The law, as now formulated, deals with the use of water for mining, for municipal purposes, for irrigation, for log driving, for power, as well as for other purposes. The Province is, by law, constituted the owner of the water, and leases it out, under specified rental and conditions, for a term of years. By the development of its present comprehensive water code, British Columbia possesses one which, as the author states, "under wise administration, cannot fail to promote the welfare of the citizens of British Columbia and will, under the Canadian form of government, undoubtedly stand the test, alike of time and of all litigation that may be brought against it." Those responsible for safeguarding and transmitting the

underlying principles embodied in this legislation from the early days to the present time, deserve the greatest credit.

The chapter includes a "Chronological Key to Water Legislation in British Columbia" and closes with a "Brief Memorandum Respecting Procedure to Obtain a Water License." The footnote and other citations of authorities in this and other chapters manifest the care with which the report has been compiled.

Electrical Inspection

Two chapters are devoted to electrical inspection. Chapter V deals with inspection by the Province. As development of electrical energy in British Columbia increased and accidents arising from its use multiplied, it was evident that steps should be taken to protect the public more

Typical natural mountain reservoirs. Anne and Joseph lakes on tributary to Indian river. Many small lakes at high elevation may be developed for storage.

adequately from such accidents. It was recognized further that companies should be protected from unjust claims made by injured parties; companies also sought protection from such pressure as might be placed upon them by municipalities desiring to impose restrictions upon operation which might prove unnecessarily onerous. These subjects are discussed, and there is appended an extensive list descriptive of the principal power installations which come within the jurisdiction of the Provincial Electrical Energy Inspection Act and of the regulations complementary thereto.

In Chapter VI. is recorded an instructive survey of electrical inspection by the Dominion of Canada and of facts pertinent to the exportation of electricity. The history of these subjects is traced from the British North America Act of 1867, and it is shown how, when stringent measures of inspection were being applied to gas companies, those interested in the gas industry urged that the

activities of their competitors from the electrical field should likewise be placed under regulation corresponding to the restrictions in force with respect to gas. The portion of this chapter which traces the evolution of the Electricity and Fluid Exportation Act is of special interest. It is shown how the forces operating to produce this legislation eventually found expression in the Boundary Waters' Treaty between Great Britain and the United States. This chapter comprises a critical study of such inter-related subjects as the International Waterways' Commission, Burton Act, Fluid Exportation Act, Boundary Waters' Treaty, International Joint Commission, and of the functions exercised by the Secretary of War, Washington, D.C., by the Department of Inland Revenue, Ottawa, by the Province of British Columbia, and by other organizations dealing with the subjects of the inspection of electricity and its exportation and importation.

Maps and Surveys

In connection with water-power development and the acquirement of lands and privileges relating thereto, those interested are greatly dependent upon maps embracing the territory involved. Sometimes it is difficult even to ascertain what may be available in the way of maps, or to which government agency application could most directly be made. In this report, Chapter VIII., commencing with the surveys of 1778 made by Captain James Cook, gives a brief history of surveying and mapping operations in British Columbia. Various detailed lists of maps are furnished, giving for each map the title, publication number, year of issue, scale and usually the approximate size. It is also shown from which branches of the Federal and Provincial Government services each class of map is obtainable.

Power Site Tables and Topography

There are six chapters, IX to XIV inc., devoted to topographic descriptions of portions of the Province and to the presentation of the tabulated water-power sites. First, the topographic and climatic features of the Province as a whole are indicated and discussed in their relationship to the distribution and characteristics of the water-powers of the Province. The purpose of this chapter is well expressed in its opening paragraph, which states:

"To convey a satisfactory knowledge of the water-power possibilities of British Columbia, it is necessary to set forth the general topography of the province and the situation and character of the mountain ranges which so largely influence the climate and the distribution of precipitation."

The obtaining of an understanding of the prominent natural features is assisted by the physiographic map included in the report.

For purposes of presentation of the water-power data, the water-powers have been grouped under five main subdivisions: The Columbia River and tributaries, the Fraser River and tributaries, Vancouver Island, the Mainland Pacific Coast and adjacent islands, the Mackenzie River tributaries.

Each of the chapters consists of a topographic description of each district with, when necessary, a more detailed reference to individual watersheds. These descriptions are followed by the power-site tables.

The Report directs attention to the necessity of carefully weighing the statements made in Chapter X relating to "Description of Power-Site Tables," which applies to all the tables, and indicates the scope and limitations of these data. It is pointed out that in making the estimates effort has been made to keep on the conservative side. It is also pointed out that, owing to the fact that the confines of watershed areas and the run-offs from many of the similar streams are unknown, estimates in such cases can only in-

dicating possibilities. The power-site tables involve some 600 streams, on some of which several sites are noted. On some streams, although no power-sites are definitely known, notes are appended indicating such information as is available. An index map accompanies the report, showing the positions of all the power-sites listed. The numbering of the sites follows a well defined order. The main stream in each case is first dealt with in ascending order, and subsequently the tributaries, also in ascending order. It will be found that reference is very readily made from the tables to the map and vice versa.

Stream-Flow and Meteorological Data

In Chapters XV and XVI, is given a concise summary of the available stream-flow data from a large number of stations, including several records made in the United States on international streams or streams in adjacent territory. The tables of stream-flow data have evidently been compiled with special care, looking to their serviceability for water-power studies. A useful index is supplied affording guide to already published data.

In Chapter XVIII there is a very complete assemblage of meteorological data. Preceding the meteorological records is an interesting discussion respecting precipitation and its measurement. Special attention has been paid to the subject of snow-fall measurement. Many valuable footnotes in this chapter direct attention to the more important publications relating to meteorological apparatus, methods and records. The chapter also includes an excellent illustration of the rain gauge of the Meteorological Service of Canada.

Maps, Diagrams and Illustrations

Two large special maps, one showing all the water-power sites, the other all the precipitation stations, accompany the report. Maps, diagrams, and well-selected illustrations, are employed to give the reader a broad outlook upon the subjects discussed and principles involved. For example, in Chapter IX, a physiographic map and accompanying description serve to convey a comprehensive understanding of the topography of the Province as a whole. Similarly in Chapter XVII, a series of well-executed diagrams with accompanying descriptions, shows the general trends and characteristics of both the hydrological and meteorological phenomena throughout the Province.

General Comments Respecting Water Powers of British Columbia

The water powers of British Columbia, owing to the exceptional physical features of the Province, possess a number of unique characteristics to which the report draws special attention. Speaking broadly, British Columbia is divided by the Coast and Cascade ranges into two regions climatically distinct. There is the Pacific littoral, including Vancouver Island, lying to the west of the summit of these ranges, and the interior region, lying to the eastward. The Pacific littoral region has a maritime climate, with heavy precipitation and run-off, and a moderate range of temperature. In many of its physical characteristics this territory resembles that along the coast of Norway. In this coastal region the mean annual precipitation varies from a little less than 40 inches along the narrow belt in the vicinity of the Strait of Georgia, where the mountain ranges of Vancouver Island exert their maximum influence to reduce the precipitation on their eastern side, to about 200 inches near Princess Royal Island, where the moisture-laden breezes from the Pacific have an uninterrupted sweep until they are deflected upward and cooled by the high, snow-clad mountains of the Coast range, resulting in heavy precipitation.

The powers along the coast are situated within a short distance of tidal water. The harbors are accessible at all times of the year. Plant operation troubles due to ice con-

ditions do not exist. The report also explains that, particularly near the heads of the coastal inlets, the mountains are covered with snowfields and glaciers, some of which are of vast size. The melting of these, especially in the dry, clear weather of summer, materially augments the stream-flow available at times of insufficient precipitation.

The interior or easterly region has what may be termed a continental climate with much less precipitation, a greater range of temperature, and run-off characteristics differing substantially from those of the Pacific littoral. Within this area we have what is known as the Dry Belt, a region of deficient precipitation, extending, with some modifications due to local variation in topography, from the State of Washington to the Yukon. In this Dry Belt the mean annual precipitation, the report shows, varies from less than 5

Typical view on coast stream. Power possibilities apparent. Canon creek, tributary to Toba river

inches to about 20 inches. Many of the streams, however, which traverse this Dry Belt gather their waters from valleys which penetrate deeply into the mountain ranges to the east and to the west, thereby receiving contributions to their flow from glaciers and snowfields. Numerous water-powers are available on such streams.

Different From Other Provinces

The report, by drawing special attention to the factors of heavy precipitation, of glaciers and snowfields and of storage possibilities, both known and unknown, shows that many water-power sites, when fully developed, may yield several-fold the power that could be obtained from sites on streams in Eastern Canada appearing, upon casual inspection, to possess similar characteristics to those in British Columbia. Investigation frequently brings out marked contrast of characteristics. Thus it is difficult to make comparison between the total water-power potentialities of such

a country as British Columbia and other areas, elsewhere situated, differing markedly in physical characteristics.

An examination of the data tabulated in the Report shows that the total estimated water-power of the Province is 3,000,000 horse-power, but of this amount about 500,000 horse-power cannot be considered, at least for many years to come, in the light of economical development, because of the proximity of railways, or possible interference with the salmon industry. The total available 24-hour power may be placed at about 2,500,000 horse-power. It must be remembered, however,—and this the report also emphasizes—that there is still considerable territory, especially in the northern part of the Province, to be more fully investigated. Therefore, taking into consideration also the fact that more storage possibilities will undoubtedly be discovered, we may

Stream descending from Hanging Valley. Mackenzie fall, Hazel creek, Toba valley, 800 feet fall in sight

in the future expect an increase in the known power of the Province. In considering the distribution of this power, it may be gathered from the report that the estimated water powers of the coastal region total approximately 1,000,000 horse-power, and the interior region 1,500,000 horse-power. Forty per cent. of the water power of the Province is therefore associated with less than twenty per cent. of its area. In the Railway Belt there is about 400,000 horse-power. With regard to the actual developments in the Province, it is noted that the installed capacity of the developed powers totals, in round figures, 300,000 horse-power, of which some 240,000 horse-power are in the coastal region, and 60,000 horse-power in the interior. About 125,000 horse-power of the developed power lies within the territory known as the Railway Belt.

The coastal powers include the large developments in connection with the cities of Vancouver and Victoria, several pulp and paper mills and some important mining de-

velopments. In connection with the latter, the report points out that the Canadian Collieries, Limited, have found it profitable to make an important water-power development for the purpose of supplying power to operate their large coal mines. In the interior, the bulk of the water-power at present generated is concentrated at the three power houses of the West Kootenay Power & Light Company on the Kootenay River. The power supplies the mining district to the southwest and various municipalities therein. This power has specially contributed to the development of this part of the Province. The three largest developments at present existent are the British Columbia Electric Railways Company's Coquitlam-Buntzen development near Vancouver, with an installed capacity of 84,000 horse-power, and a head of 400 feet; the Western Power Company of Canada, with development on the Stave River having an installation of 40,000 horse-power, and a head of 120 feet; and the developments on the Kootenay River just referred to have a total capacity of 40,000 horse-power operating under heads of 70 feet and 34 feet. The highest head developed in the Province is one of nearly 2000 feet by the Britannia Mining and Smelting Co., at Howe Sound. The Jordan River development of the British Columbia Electric Railway Co., of Vancouver Island, has a head of 1145 feet.

No Powers of Large Size

Looking over the tables one is impressed with the fact that British Columbia is not conspicuous for water-powers of phenomenal size. There are but three or four sites with potentiality in the neighborhood of 100,000 horse-power each, and only an odd dozen of 50,000 horse-power or over. There are, however, some 50 known powers exceeding 10,000 horse-power each and a number of groups of power-sites on the same or neighboring streams which could by co-ordination be linked up to form systems aggregating considerably more than 10,000 horse-power. Doubtless, some of the sites at present rated below 10,000 horse-power may in the future, by virtue of the discovery of increased storage possibilities, be able to yield more than the present estimates.

The tables also reveal the fact that some areas of the Province are exceptionally well supplied with water power. For example, within 50 miles of Nelson there are water-power sites, chiefly on the Kootenay and Pend-d'Oreille Rivers, having an aggregate potentiality of 400,000 horse-power, of which about 50,000 horse-power has been developed. Again, within 50 miles of Vancouver, there are water-power sites aggregating some 300,000 horse-power, of which 90,000 horse-power is developed.

It is interesting to note that Vancouver Island, with its area of 12,600 square miles, is well provided with water-powers strategically situated. All along the Pacific coast there are hundreds of smaller mountain streams capable of furnishing cheap and readily developed small powers, from one to several hundred horse-power each.

When one considers the diversified nature of the natural resources of the Province, it is recognized that the water-powers of British Columbia have an exceptionally wide field of usefulness. The needs of municipalities, of electric railways, of manufacturing, of mining operations, of the forest resources, including pulp and paper mills, and of the electro-chemical industries, surely suggest great use for the water-powers of the Province, not to mention the probability that water-power may be more extensively used in connection with pumping for irrigation.

The only difference between a grave and a groove is the slight matter of depth.

Here's a Christmas Present for You

YOUR WINDOW DISPLAY IS YOUR BEST SALESMAN

Between now and Christmas the Electrical-Dealers of Canada will be putting forth their best efforts to attract the holiday trade and some fine window displays will be shown.

The biggest problem before the electrical industry to-day is not engineering or manufacturing—the real problem is “merchandising.”

We believe that well dressed windows—goods properly and tastefully displayed and demonstrated—are the most effective means of increasing the sale of electrical appliances.

With a view to encouraging the art of window dressing among electrical contractor-dealers, and, also, having in mind the value of the interchange of good merchandising ideas, the Electrical News offers four prizes for best dressed windows, under the following conditions:

- | | | |
|-----|--|---------|
| (1) | First prize | \$35.00 |
| | Second prize | 20.00 |
| | Third prize | 10.00 |
| | Fourth prize | 5.00 |
| (2) | The contest is open to any electrical contractor-dealer, municipality or central station in Canada. | |
| (3) | Photographs of window displays must be in our hands by December 31, 1919. | |
| (4) | Explanatory notes up to 100 words may be submitted with each photograph. | |
| (5) | The merits of the photographs will be judged by an impartial committee of three—one manufacturer, one jobber, one contractor-dealer. | |

Plan now to enter the competition. You have an even chance to win a prize. In addition to that, however, it is a dead certainty that your effort to produce a better window display will be reflected in your more abundant Christmas trade.

Address photographs and all communications:

“Best Window” Contest,

Electrical News,

347 Adelaide St. W., Toronto.

The Contractor-Dealer

Factors Which Determine the Success of a New Store—Getting Under Way and Choosing a Name — The Dealer's Own Home Should Be Completely Equipped

Mr. E. A. Drury, one of the best and most favorably known electrical contractors in Toronto, has just opened an attractive store at the corner of Oakwood Avenue and St. Clair Avenue. This is a rapidly growing district and a location well able to support a first-class electric store. Mr. Drury is already well known to the people of this district, having lived a few doors from the new store for some years, where he carried on a wiring and contracting business.

Since the organization of the Toronto electrical contractors Mr. Drury has been one of the most enthusiastic and helpful members of the Association. He is full of good, snappy ideas, places them before his fellow-members in clear, forceful terms, and then, best of all, works energetically to carry them to accomplishment. He has the best wishes of his fellow-members for the highest success in his new venture.

In planning the details of a new store there are many things to be taken into consideration—location, publicity, salesmen, service, etc., etc. One point about Mr. Drury's store location is its proximity to a very popular "movie" theatre. In this connection a very helpful article appears in a recent issue of the *Journal of Electricity*, written by M. J. H. Moseley, formerly advertising manager for the Western Electric Company. Since this article has a direct bearing on the question of Mr. Drury's new store, we quote as follows:

Since I must have a place of business, the first consideration is the location of my retail store. The two factors involved are (1) rent, and (2) accessibility. I shall pay as much rent as I can afford, based on a certain estimated volume of business. Having determined my maximum rent figure, I shall pick out the most accessible location I can secure for this amount of money.

In choosing a location it is a good idea to take a plot of the town, regardless of the size, and determine on which side or in which portion of this town are the greatest number of prospective customers. Furthermore, which side of the town is most likely to grow fastest. Having decided this, the question of location is half solved. The problem can be limited still further by dividing that half of the town selected into two parts. This will give a small sector of the business portion in which I shall try to locate. In what part of this section shall I try to secure a place? If my rent allows, I shall select a place near a moving picture show, a successful confectionery store, or any other prominent concern which advertises liberally. A location near a moving picture show is good on account of the ability to make night window displays to a good audience.

Let's assume I have secured a location near a moving picture show. The next question is, what shall I call my-

self and how should I make my store stand out as the most prominent one in the block?

Jones is a plain name, so suppose I decide to have my firm name "Just Jones." This can be interpreted in two ways; first, as meaning just ordinary, plain Jones; and second, as meaning "Just" Jones, giving the idea that I am absolutely just in all my dealings. It would be different from the ordinary name of "Jones Electrical Company" and would have an individuality to it.

Now, the chances are that my neighbors in a town of the size mentioned would have rather elaborately decorated window signs, consequently in order to get contrast, suppose I simply letter "Just Jones" in two or three-inch gold letters on the window glass either side of my door, paint the store front a prominent color to contrast with

Exterior view and window display—Mr. E. A. Drury's store, Oakwood and St. Clair, Toronto

the others in the block and have made up a neat electrically-lighted sign with the name "Just Jones" on it.

I will, of course, want to use the same name on my envelopes, letterheads and billheads; and by all means these should be printed in the same kind of type as that used on the show window and electric sign.

I am now ready to open my store and put my wares before the public. The ordinary merchant would probably insert a full page ad in the newspaper and possibly send out circular letters to a selected list of friends. Consequently, in order to be individual, I shall secure some special yellow envelopes with my imprint thereon. These envelopes to resemble as much as possible the ordinary telegraph envelope. The inserted message might have the same heading, and read like a telegram.

In the lower left-hand corner on the message sheet should appear a small illustration showing a plot of sev-

eral blocks of the town, with an arrow pointing to Jones' location.

If this message is printed in the same manner in two or three issues of the local paper, the chances are that the combined publicity will result in quite a few people visiting my store during the opening week. From these visitors a considerable number of leads should be obtained, to be followed up later by a salesman.

The Daily Drive for Business

I have now opened my store and am ready to start a hard every-day drive for business.

Here are the kinds of business I am going after:

1. Home wiring and fixtures.
2. Commercial wiring and motors.
4. Lamps.
5. Household appliances.

Home Wiring and Fixtures

Where does this class of business originate? There are two classes of buildings on which to work:

1. New buildings.
2. Existing buildings.

Contracts with new homes can be made best through:

- The Real Estate Man,
- The Architect,
- The Contractor and Builder,
- The City Building Permit Records.

Now, where shall I start in order to get this business?

Charity Begins at Home

Without a question the first place to start is at my own home. My home should have everything in the way of modern wiring and fixtures, so that I can actually show prospective customers the utility of having receptacles in the proper places, and the decorative effect of having the right kind of fixtures.

If, through force of circumstances and lack of capital, I cannot equip my home in this manner to start with, then I shall pick out several prominent homes in the city and work very hard on them until they are equipped in a proper manner. I then shall have examples through which to sell my other customers.

The best kind of advertising, and that which makes the greatest impression, is the citation of particular and specific facts. For example, when I have finished up a particularly nice job of house wiring and fixture installation, here is a chance to send a circular letter to my entire mailing list of real estate men, architects, builders, etc., calling attention to the fact that the house in question has just been wired and illuminated by me and suggesting that they go around, and see it at the first opportunity. Existing homes which offer prospect of new fixture installations and changes in wiring can gradually be listed for use in the manner suggested above.

Another opportunity of keeping in contact with such prospects is to send them a short letter, notifying them of the receipt of new fixtures, attaching, if possible, a circular illustrating the fixture in question. Almost everybody is glad to keep pace with the times and will appreciate attention. Such letters may not result in actual orders at the time, but eventually they are going to have the desired effect. I will not send out a letter unless I have something to say. This is a simple rule which if followed will surely bring success.

Commercial Wiring and Fixtures Next

Where shall I start on my commercial wiring and fixture business? Once more it is necessary to have an example to start with, and my own store is the best example I can have. It might be a good idea to design the

fixture plan of my own store so that it can be changed occasionally, looking new and up-to-date at all times.

It will be easy to build up a mailing list of all the stores in town needing re-designed fixture installations. Here again the mailing list will come into use every time I re-design the fixture installation in any store, or wire a new store.

When I fix a new store window for some one, I shall work to get as attractive a display as possible, and it might be advisable in such cases to actually check up the number of people passing and the number who look in, using this data in a letter to other prospects.

Following Up Prospects

Prospects for industrial wiring and motors can also be built up into a mailing list. This mailing list can be utilized in a manner similar to the other mailing lists noted

A partial interior view of Mr. Drury's new electrical store

above. While such a list may not contain, for a small town, more than 10 to 50 names, nevertheless it will be worth while to have it.

The best way to start this business successfully is to start a service system for taking care of the motors already installed in the neighborhood. This might be called "Just Jones Motor Service," and would consist of the cleaning and oiling of all motors of a customer once a month for a stipulated sum. This sum must be set for each customer and should be sufficient to cover the cost of doing the work, the cost of the oil, and a small profit. I will find that the leads obtained from a service of this kind will be of great value, because by monthly contact I am sure to know when a man is contemplating the installation of an additional equipment.

In making my bid on this equipment I can well afford to include service for a period of six months or a year. This would be a strong factor in fighting competition.

The moving picture shows perhaps lead most businesses in the way of exterior illumination, consequently here is a place to start for lamp business.

Other stores having electric signs are also good prospects, and this business should be built up on a service basis entirely.

My desire is to get my customers to sign up with me for lamp service for six months or a year at a time. During this period I shall make it a point to look at their electric signs at least two or three times a week and their lamp stock at least once a month.

Can You Think of Anything Better Than AN ELECTRIC SERVANT

Whatever you choose:

IT is Safe,
IT is Sanitary,
IT is a Labor-Saver,
IT is Moderately Priced,
IT is Attractive in Appearance.

Electrical appliances transform the drudgery of housework into the joy of congenial recreation.

Toaster, Fan, Iron, Percolator, Vacuum Cleaner, Washing Machine, and a host of Other Things—all prices—all useful.

Shop Early—We'll hold them.

THE ELECTRIC SERVANT SHOP

Developing New Business

By W. S. Byrne*

We find ourselves confronted to-day by a problem which becomes increasingly difficult as time passes. Construction, reconstruction and development expenses mount apace while our economies in manufacture have apparently reached that point at which little improvement can be expected from the introduction of new methods of manufacture or increased efficiency of apparatus. Our rates of return, too, in the vast majority of instances remain as in the pre-war period. But we must progress, and we have before us but one means of meeting the exigencies of the situation—new business.

Increase Volume of Business

We must secure an increase of volume which will reduce in proportion the cost of production and operation. We must make two kilowatts grow where but one was before. New sources of outlet and income must be found, and when I say "new" I do not necessarily mean only new purchases, but increased use by existing customers as well. Probably in many instances, new products must be marketed or our present commodities or service must be marketed in a new way.

It has been the experience of our company that the sale of merchandise can quickly be made, with a little intensive effort, 15% of the former income to the property. Putting this statement in a different way, it can be said that the merchandise business of a community of about 200,000 can very readily be made approximately \$1.50 per capita. In small communities, the income per capita should be correspondingly higher as a result of more direct contact with the purchasing public. This is not a matter of theory—it is exact fact brought out through analysis of our operation in small and large communities.

The public, however, can only be sold after your organization is sold. Acting on this principle, we were able in the month of March, this year, to show an increase of 72 % over the preceding month, and a 12% increase in April over March.

This condition is being maintained and is no sporadic peak. It is the healthy condition of our business and market. These facts are proof of the truth of certain principles. First, irrespective of selling price and discount to the dealer, there must be selected types of appliances to be sold in which you have confidence and on which you are willing to stake the good name of your organization. Select that washing machine and vacuum cleaner which will unquestionably give service to the user and can be known in your community as the best device of its kind sold.

Second, secure from the manufacturer of these appliances the services of one of their factory experts who not only knows the quality and workmanship of the device in question, but who can bring the story home to your sales force, your repair force and in fact, your entire organization. Convince them that this is the appliance they should use in their own home and make it attractive for them to use it. Derogatory comment by a repair man can un-sell more appliances in one hour than your sales force can put out in a month.

Third, be prepared to give service on these appliances which is expert and rapid.

Fourth, demonstrate these appliances to the user until she or he is unquestionably versed in their proper use.

Fifth, bear in mind the fact that if you have not been merchandising in a broad way, it is necessary to overcome

the fly wheel effect of your organization against the progress of merchandising, and you must offer at least initially to the public, and to your organization, inducements which will convince them of the necessity of purchasing or selling these appliances.

Planning the Campaign

When I say, offer an inducement to the public, I do not have in mind promiscuous price cutting. The successful and profitable policy is to sell at list prices, but since we are not essentially merchants, we can well afford to study the methods of the department store merchant in the same way in which you would expect him to study your methods in the manufacture of electrical energy.

In the opening campaign, you will find that it will probably be necessary to offer some nominal cut in price on some device or an improvement in payment terms, and some monetary inducement to your entire force to stimulate sales.

"Nothing succeeds like success." Carefully select the device for your first campaign. Plan the campaign, its advertising and the details of its conduct in such a way as to secure big results. This having been accomplished, the pioneering is over. Now keep eternally at campaigning.

On one particular device, we found it necessary to increase our selling price as a result of the termination of a pre-war contract. Before putting into effect this increase in price, we advertised and made it known through our organization, that due to this condition, it would be necessary for us to increase the price of this device on a certain date. As a result of this statement and our advertising, our sales in this particular line increased about 25% over previous sales. Following the change in price, and for the purpose of instilling confidence in our organization as well as putting over the new price, we conducted a two weeks campaign at the increased price but made a reduction in the monthly payments when sold on the deferred payment plan. These new terms were advertised, the sales force went out with renewed vigor, and in spite of the increased price which was over 12%, we were able to increase our sales during the two weeks campaign to a point where they exceeded the sales of the former campaign by about 50%.

Public Like Deferred Payments

Another fact which may be of interest and which our experience has brought out, is that the public generally is satisfied to pay an additional price or carrying charge for purchases on deferred payments. We are making a difference of from 7½% to 12% in the selling price of our appliances sold on the time payment plan.

Persons who desire to purchase on this basis are reconciled to that fact. They generally realize that the protection is due you, and the unqualified statement may be made that the cost of carrying these accounts can be charged to the purchaser in this way and meet with his approval.

If you are selling a device which you know will give satisfaction and in which your sales organization has confidence, it is unnecessary at this stage of the public's familiarity with the appliance, to demonstrate it in the home before purchase.

During the months of March and April, we were able to save \$1,200 expense incident to the delivery and damage of washing machines and vacuum cleaners resulting from permitting them to be used in the home, by insisting that with our guarantee we knew that if the prospective customer was interested in the purchase of a given device, he could afford to make the initial payment or buy the machine outright before having it delivered to his home for use.

Now as to the matter of new business resulting from

*Before N. E. L. A. at Nebraska.

the increase in the sale of our service. Many of the factors that caused us concern in our industry are pinching the toes of our prospective customer, and we may, as a result, secure audiences and consideration where the prospect has heretofore been adamant.

Increase in Rates

It is a generally accepted fact that even where increases in rates have been secured, the increase has not been in direct proportion to the increases in manufacturing expense. This fact, your local miller, elevator man or pumping station, may not realize. It is certainly most timely that new proposals and new estimates of the customer's present expense should be brought to his attention.

Business generally is in the most prosperous condition it has known for years. Men are more concerned in their operating conditions and are more cunning in their efforts to effect economies than ever before. In the vast majority of cases petty prejudices and former apparent high costs can be set aside through the active solicitation of power business, particularly. You are warranted in redoubling your efforts, and judging from the experience of numerous central stations, your success is practically assured.

Mercantile institutions are presenting their wares, and are operating their establishments in a way hitherto unthought of. Lighting is one of their best invitations for the customer to purchase. Let us cash in on this condition. We build not for to-day. The saturation point is a thing unheard of to the consumer. Let us, therefore, make known our wares, apply our fullest energies, and reap the harvest at hand.

Starting Things With a Plan*

When a man builds a house he first has a plan. In building a business, the better and more thorough the plan, the bigger and better will be the resulting business. And in building any branch of a business a plan is just as necessary.

We recently demonstrated this to our complete satisfaction. June and July had always been slow months with us in vacuum cleaners. To give our ideas a thorough test we decided to run a vacuum cleaner campaign in this off-season and at the same time to lay the foundations for a bigger and better vacuum cleaner business. So we laid out a plan covering the use of all kinds of advertising at our disposal—our windows, movie slides, circular letters, generous newspaper space, and a good salesman. Here is the schedule:

June 12th—Windows trimmed. The trim announced that a vacuum cleaner would be sold to the highest bidder.

Movie slide started in the local theatres to run every night.

A 22-inch single-column ad in both daily newspapers.

June 14th—First circular letter mailed to 300 cleaner prospects.

June 17th—A 2-column 20-inch advertisement in both newspapers.

June 21st—A 2-column 20-inch advertisement in both newspapers.

June 24th—A 3-column 22-inch advertisement in both newspapers.

July 2nd—A full page advertisement in both newspapers. Reproduction of this advertisement mailed to the 300 prospects.

July 7th—Third circular letter mailed to the 300 prospects.

July 10th—A cracker-jack salesman secured from our jobber started his calls on the prospects.

During the week of July 10th we sold 25 vacuum cleaners, which is as many as we had sold in the past two years. Our sales up to August 1st amounted to 50, and we expect to

sell somewhere near 150 before the year is over. Considering that our town has only 4,000 to 4,500 people, this will be a fair record for the first year.

It takes faith to spend money for a campaign like this, because the immediate returns will barely pay the expenses of the campaign. In laying out the campaign and paying for it, I kept constantly in mind that I was not after immediate sales so much as future business. I am thoroughly satisfied with the results—we are now known as the vacuum cleaner house.

Put "Momentum" Into Your Sales Effort

The following account is given of an occurrence during some repair work recently carried out in a western town. It illustrates the value of "momentum."

At the point where repairs were being made a corner pole was anchored to a rock in a field, partly buried in the ground. A colt grazing in the field was frightened by an automobile and started on the run. He hit the guy, lifted the rock which weighed at least half a ton, and threw it about 7 feet, breaking several circuits.

The colt was uninjured. Under ordinary circumstances, it would take two horses to move the stone and the workmen were unable to understand it. The superintendent said there were two agencies connected with it, colt and momentum. "That's just what many of us want—more momentum if we expect to accomplish anything really worth while!" he adds.

Live Wires Hold Their Annual Meeting

The third annual meeting of the Vancouver Electrical Contractors and Dealers was held last month in the Citizens' Club, Vancouver, B. C. There was a representative attendance with President E. Brettell in the chair. The election of officers for the ensuing year resulted as follows—President, E. Brettell, re-elected; executive council—Messrs. S. E. Jarvis, H. B. Rankin and C. H. E. Williams. Those present were afterwards entertained to dinner followed by a number of interesting addresses. Mr. George E. Kidd, general manager of the British Columbia Electric Railway Company, spoke on impressions of his recent visit to the old country. Mr. R. P. S. Twizell had something of interest to say on architecture in its relation to electricity, and Mr. H. Mercer spoke on electrical engineering. Capt. W. J. Conway declined to accept the secretaryship for another year; this matter will be dealt with at a subsequent meeting.

Trade Publications

The following new literature has been received from the Ingersoll-Rand Company, 11 Broadway, New York City, N. Y. Copies free on request:

Form No. 8707.—This is a forty page, 6 x 9 in. bulletin, on "Little David" pneumatic drills, grinders and saws; illustrates the various sizes and models of the different machines and contains detailed description concerning the particular tool to use for a given purpose. The descriptive matter is supplemented with a number of tables giving air consumption of the various tools, etc.

Form No. 945.—"Tis a Good Investment" is a subject of an 8½ x 11 in. form illustrating ER and FR compressors in small machine shops, power houses, garages, etc.

Form No. 954.—An 8½ x 11 in. sheet descriptive of the "Air Lift Method of Pumping."

Form No. 9029.—Is the Ingersoll-Rand Company's Pictorial Products catalog; virtually a picture book, illustrating and describing practically the entire line of products marketed by this concern.

*By R. A. Jeffers in "Contact."

An Attractive Winnipeg Store

Stock Conveniently and Prominently Displayed—
Prices in Plain Figures—Business Rapidly
Outgrowing Capacity

One of the most up-to-date electric shops in Western Canada is that of the Electric Appliance Company, situated in Winnipeg's busy down-town district on the corner of Notre Dame and Portage Avenues. This concern, as the name indicates, has confined its efforts particularly to specializing in the sale of electric appliances. That this endeavor to specialize in appliances exclusively has met with success is evidenced by the statement of manager G. F. Weir, that the store is not large enough to take care of the rapidly increasing volume of business.

There are no frills in the methods of merchandising which have contributed to the success of this business. When a customer enters the door he is at once impressed with the cordial greeting, the crisp business atmosphere prevailing and the desire on the part of the sales force to display and fully explain in plain English, without resorting to technicalities, the various merits and uses of the different articles of merchandise. Whether a customer makes a purchase or not he is bound to leave with a most favorable impression, which should be a big factor in determining where he will place his patronage when his mind again turns to things electrical.

The stock is conveniently and prominently displayed on tables and showcases within easy reach of the customer, and giving every possible opportunity for the power of suggestion to prompt investigation and purchases. As will be noted in the photograph of the interior, the various classes of electric lamps are displayed on a rack on the wrapping counter with prices of each in large figures.

Attractive display of the Electric Appliance Co., Winnipeg.
Attractive show cards help to tell the story

This practice of plain figure marking is carried out on all articles. What has proven to be one of the greatest aids in the sale of the innumerable small articles handled in this business is the fixture shown standing behind the counter. This follows the line of display used extensively in hardware establishments where a series of small drawers contain the articles, while a sample of each one, with its

price, is attached to the outside of the drawer, and in full view of the customer.

A small display space in the daily press is used consistently for announcing special articles as a store sales' feature for several days' selling, while the window display

Interior Electric Appliance Company's store, Winnipeg. Goods conveniently and prominently displayed on tables and in showcases

is worked to one hundred per cent. capacity, with frequent changes of display, attractively arranged, and proves to be a remarkable business producer.

Be a Business Builder

It is one thing to be a salesman and another thing to be a business builder. Certainly every progressive man desires to be and should be a business builder. Unfortunately, however, a great many of us are too apt to merely take the order and fall into the class of mere salesmen by not giving proper consideration and time to the necessary demonstration and servicing of the article sold.

There are at least three distinct steps in every completed sale. The sale, the demonstration and the servicing of the article sold.

In the disposing of more technical apparatus, the importance of demonstration may be lessened because the people to whom you sell have the necessary knowledge to use the article as it should be used.

This course, however, cannot be followed in the sale of the more commercial products.

One of the greatest evils of the day in the sale of electrical appliances is the lack of sufficient attention to demonstration, and quick and competent servicing. It is just as much the duty of every salesman of such apparatus to demonstrate it as it is for him to take the order. The greater the advantage of the appliance, the greater attention due the details from a standpoint of demonstration.

There is just as much difference between ironing with an electric iron and ironing the old way as between driving a horse and buggy and an automobile. This is equally true of all the appliances and it's up to you, as business-building salesmen, to get this idea across to your customer, whether he be central station, agent, jobber, dealer or individual customer. If you don't know how to demonstrate the article, find out.—The Circle.

Toronto Contractors Hold Successful Meeting

A splendidly attended supper meeting of the Toronto Electrical Contractors was held on the evening of Thursday, Nov 6, the president, Mr. Kenneth A. McIntyre, in the chair. This was the first meeting since the trip to Buffalo, and the members were enthusiastic over what they had seen and heard, and expressed themselves quite freely as having gained a number of good merchandising ideas that they were since putting into effect.

The Morris plan of financing instalment payments came in for considerable discussion. It seems to be an established fact that the best results in retail electrical merchandising can only be obtained by distributing payments over a considerable period. Such a plan, however, is too great a tax on the finances of the average contractor-dealer. The result is that there are too few electrical stores and the merchandising of electrical goods is being handled, badly for the most part, by retailers in other lines. Mr. Carthy and Mr. Drury were appointed a committee to look into the matter in Toronto and report whether any of the banks or loan companies would look with favor on any scheme of financing for the members of the Toronto association.

Mr. McIntyre, early in the evening, mentioned to the members the advisability of joining The Electric Club of Toronto and attending their weekly mid-day luncheon-addresses. It is typical of the broad-minded outlook of the Toronto contractors that about two-thirds of the members joined up on the spot—and the others are coming. The collection of the fees was greatly facilitated by the presence of Mr. C. H. Hopper, treasurer of the Electric Club, whose gratitude, later in the evening, found expression in a neat little speech full of humor and wise counsel.

Capt. R. T. Smith Joins Benjamin Co.

Captain R. T. Smith has been appointed in charge of sales promotion work for the Benjamin Electric Manufacturing Company, Toronto. Captain Smith has had a wide experience in electrical matters, for a number of years with the old R. E. T. Pringle Company, of Montreal; later, from 1907 to 1912, he was with Mr. Irving Smith, Montreal, as manufacturers' agent, and for the next two years covered the province of Saskatchewan for the Canadian British Engineering Company, where he was working up a fine trade, when the war broke out, and he enlisted as a gunner with the Canadian Field Artillery. Captain Smith saw five years' service, practically all at close range.

The Benjamin company are conducting a vigorous campaign, which is meeting with splendid success in placing their well known products in the hands of the consumer. Mr. F. J. Allen, general manager, states that factory managers, in general, are much more appreciative than formerly of the value of good lighting in increasing both, quality and quantity of production. Benjamin equipment is contributing very materially to this end.

Hardware Store Sells 32 Volt Iron for 110 Volt Service

"Contact" prints a letter from the manager of a municipal lighting plant which throws an interesting sidelight on the conduct of an electrical business by a hardware store.

"I have charge of the light plant here.

"The light plant does not sell electrical appliances. Two hardware stores sell electrical appliances. They do not push the sale of them any.

"I believe they could sell electrical goods if they would take a little interest in showing them off and trying to interest people in them.

"I know I could sell appliances if it were not for mak-

ing the other fellows sore, which would not do as they are on the town board and this is a municipal plant. I have been a subscriber to "Electrical Merchandising" since it was issued.

"This town, like a good many other towns who have municipal light plants, have let their plant run down, until it is a badly losing property. If they would put in a couple of new engines and push the wiring of houses and then push the sale of electrical appliances they could have a paying electric light plant.

"To show you how much interest the hardware stores take in the sale of appliances I will describe an incident. I have been called on two or three times to put in new fuses in houses. When I would ask them what they were doing when they blew the fuse they would answer, "I was just trying to use my new electric iron." On examining the iron in two different cases I found them to be 32-volt irons. Can you beat that? Not taking enough interest in the sale of the iron to see whether it was the right iron to use on 110 volts or 32 volts."

Extensive Co-operation for Entire Industry for the Holiday

There is a point in holiday selling that the retailer frequently overlooks. It is the fact that, in spite of natural increase in buying by the public at Christmas time, selling pressure should be kept up at that time and the retailer should add to his force and his stocks, if need be, to capitalize the holidays to the utmost. Because while the public is liberal in opening its purse for buying at Yuletide, it ties up the strings immediately after Christmas and there is usually a "valley" following the peak of holiday purchasing.

As announced in our last issue the Society for Electrical Development has developed an extensive Christmas campaign for making the coming holidays more profitable for the retailer, and to help make him provide against the post-holiday drop in buying by building up a good reserve.

The underlying "theme" or motive of this campaign is to make this another "ELECTRICAL CHRISTMAS," which idea is brought out forcibly in a beautiful poster design, lithographed in seven colors. This can be hung in windows, on doors and in the store. The same idea is dominant in the window-cards, poster-stamps and price-cards, all of which show the poster. Constant reiteration of this "theme" will have a favorable effect on the shoppers, if the retailer will use all the sales helps consistently.

Another notable fact about this campaign is that the Society does not limit all the co-operative help to members exclusively but distributes certain things to non-members as well, without charge. The scale of prices for the various material was published in our last issue.

Siemen's Representatives Visit Canada

Messrs. F. H. Leonard and W. B. Hopkins, of Siemens Bros. and Co. Ltd., London, Eng., have been on a visit to Canada, in connection with a 14 months' tour of the world investigating trade conditions. The company is represented in Canada by the Siemens Co. of Canada Ltd. of which Mr. C. W. Stokes is manager. Messrs. Leonard and Hopkins report that there is a very large demand for electrical equipment of all kinds throughout the world, especially in South America.

Advise your customers to keep all lamps and all reflectors clean. The loss of light due to dirt on bowls or reflectors may amount to as much as 60 per cent.

New O-B Arc Weld Bond for Electric Railways

Electric welded bonds are growing in popularity because when they are properly installed they are mechanically and electrically permanent. The Ohio Brass Company of Mansfield, Ohio, has developed an arc weld bond that makes it easy for an operator, after a reasonable amount of practice, to get a good job at every joint. The bond is made in two types—AW 2 and AW 3. Essentially these two types are alike. The body is of copper strand and the terminals are copper protected by a steel sleeve. This steel sleeve is

O-B Type AW2 Bond

O-B Type AW3 Bond

In an acute angle the arc plays against one side and misses the bottom of the scarf

In a right angle the arc makes a good weld down in the corner

mechanically and electrically united with the copper in the factory. On the job the operator welds "Steel to Steel"—the easiest kind of electric welding. Another fundamental arc welding principle is embodied in the bond in that the weld is built up in a 90° angle. Experts have found that in order to get a good weld between two parts being joined, the arc must be played into an angle of not less than 90°. Otherwise the arc will play against one side of the groove and will not effect a real union in the bottom of the weld, the important place in rail bonding.

Handsome "Universal" Heater

A very attractive heater of the reflector type is being distributed by the Canadian General Electric Company. The unit is one of the "Universal" products. As shown in the illustration, the base is triangular in shape, but its chief

attraction is in the finish—a dull moss green—making the effect very artistic and decorative. The heating element is the spool type so popular with a number of manufacturers.

Telephone City Electrical Club

The Telephone City Electrical Club have elected the following officers for the year 1919-20: President, Mr. A. C. McLean; vice-president, Mr. H. E. White; secretary-treasurer, Mr. Fred Perry.

The New Farm Help

The Westinghouse Electric Manufacturing Company have issued a very attractive bulletin entitled "The New Farm Help" which explains how electricity does the work, saves expense, provides safe illumination and reduces the labor of the women folks on the farm. Well illustrated.

Poster distributed by Society of Electrical Development

Outdoor Substation Public Policy*

The day of constructing outdoor substations simply to meet load conditions, regardless of appearance and adaptability to changing conditions, soon will be a thing of the past. People object to unsightly structures in their neighborhood and a substation built without regard to appearance is an obstacle in gaining good will for the utility. Wood

pole structures are much inferior in appearance as compared to steel, often cost more and have greater depreciation. Central station public policy of to-day demands that an outdoor substation must present a pleasing appearance.

*By H. W. Young, President Delta-Star Electric Co.

There are two angles to this: The public utility which can show properties and equipment that have a good engineering appearance can more easily attract financial backing. The public utility which makes its outdoor substation construction neat in appearance arouses community pride and good will. Foresight is one of the chief factors for success in any line of work and foresight in selecting substation designs will produce good revenue and good will—both of which utilities need.

Personals

Mr. W. G. H. Carn has been appointed electrical and power engineer for the Canada Cement Co., Montreal. He was formerly engaged in the design and construction of lighting and power systems in the vicinity of Montreal.

Mr. W. F. McKnight, wire and cable sales engineer of the Northern Electric Co., Toronto, has been transferred to the Head Office at 121 Shearer St., Montreal, to undertake new duties as Educational Director for the Company.

Mr. C. H. Tillet has been appointed signal engineer of the Grand Trunk System in succession to Mr. R. F. Morkill, resigned. Mr. Tillet joined the signal department of the Grand Trunk in 1913, and was appointed supervisor of signals on the eastern lines of the system in that year. He was made electrical engineer of the signal department in June 1918, and acting signal engineer in December 1918, a position which he has held until his present appointment.

Mr. W. P. O'Brien has been appointed manager of the reorganized and enlarged New Business department of Montreal Light, Heat & Power Consolidated, with which department Mr. W. B. Johnston—who goes to New York City to handle the sales end of the Brantford Violet Rays—

Mr. W. P. O'Brien

was formerly identified. The scope of the department now under Mr. O'Brien's direction comprises power sales, electric and gas service sales, industrial gas appliances and services, branch offices and stores. Mr. O'Brien has been with the Montreal Light, Heat & Power Company for nearly twenty years. For the last eleven years he has been connected with the Power Sales end of the company's business, and for the last two years has been Manager of the Power Sales department.

Current News and Notes

Bowmanville, Ont.

The ratepayers of Bowmanville, Ont., will vote on the Hydro Radial by-law on November 22.

Chatham, Ont.

The Chatham Hydro-electric Commission have commenced taking over the service lines formerly supplied by the electrical department of the Chatham Gas Company which was recently purchased by the city. It is expected that the city will be entirely supplied with Hydro power by January 1.

Didsbury, Alta.

A by-law will be submitted to the ratepayers of Didsbury, Alta., on a proposal to dispose of the present light and power plant and purchase power from the Olds Electric Company, Olds, Alta.

Elk Lake, Ont.

A proposal is on foot to develop power at Indian Chute on the Montreal River, about 12 miles above Elk Lake, Ont., where it is said five thousand horsepower is available. This power would be used principally in the Matatchewan gold mining area, about fifteen miles north, and also in the Gowganda silver mining region within a radius of 10 to 25 miles west.

Hamilton, Ont.

Hamilton, Ont., is one of seventeen municipalities that will shortly be called on to guarantee bonds for a hydro radial that is proposed from Hamilton to Elmira, Ont.

Montreal, Que.

X. Limitee have been granted letters patent and will take over the business of Volt Electric Registered. The head office is in Montreal and capital stock \$49,000.

The International Electric Company, Limited, Montreal, have registered.

Adanac Storage Batteries, Limited, Montreal, have been granted a charter.

Oshawa, Ont.

The Hydro-Radial by-law will come before the ratepayers of Oshawa, Ont., on November 22.

Toronto, Ont.

A permit has been granted to the Canadian Allis Chalmers Company to erect a pipe-galvanizing plant at their foundry in Toronto.

Bates and McPherson have succeeded to the business of the Ross Electric Company, Toronto, contractor-dealers.

It is reported that the Hydro-electric Power Commission have purchased a portion of the Glebe property on Danforth Avenue, Toronto, for the purpose of erecting a power station in connection with the proposed eastern radials.

The Ontario Railway and Municipal Board have ordered the Toronto Railway Company to commence construction of a carline on Pape Avenue, to be completed not later than July 15, 1920.

Whitby, Ont.

The Hydro radial by-law will be voted on by the ratepayers of Whitby, Ont., on November 17.

Windsor, Ont.

The ratepayers of the nine border municipalities will vote on December 6, on the question of purchasing the Sandwich, Windsor & Amherstburg Street Railway, a subsidiary of the Detroit United Railways, at a cost of \$2,100,000.

Advertisements for tenders, equipment, wanted or for sale, etc., or miscellaneous, are charged at \$2.80 per inch.

All advertisements must be in the publisher's hands by the 10th or 23rd of the month to insure insertion in the subsequent issue.

WANTED — TECHNICALLY TRAINED MAN with view to taking up designing of electrical apparatus, principally A.C. motors. An opportunity for the right party. Box No. 27, Electrical News, Toronto. 19-22

ELECTRICIAN AND MECHANIC desires responsible position. Sixteen years experience hydro-electric station operation, maintenance and superintendence. Available after December 1st. Box 47, Electrical News, Toronto. 21-22

For Sale

Wagner 3 H.P. Motor, single-phase, 60 cycles, 110 volts, complete with 2200-110 volt transformer, both in good condition. For further particulars write E. J. Groves, Parry Sound, Ont. 21-22

Transformers

We now have a well-equipped shop for the repair of service transformers up to 50 K.W. capacity.

This is our specialty and we have had considerable experience along these lines.

Instead of discarding burned-out transformers, send them to us for expert repairs. We are prompt and can give satisfaction.

E. J. GROVES,
Box 422, Parry Sound, Ont.

ELECTRICAL REPAIR & SUPPLY CO., 71 Wellington St., SHERBROOKE, Que.

A Six-Months' Advertising Schedule

"For our newspaper advertising," says John A. Glover, General Superintendent of the Urbana, (Ill.) Light, Heat and Power Company, "we make out, six months in advance, a schedule of the merchandise we wish to exploit each week. For example, for the period of January to July our schedule contained display advertisements on the following subject, about in the order given, and then repeated in a different form:

- 1st week—Washing machines.
- 2nd week—Vacuum cleaners.
- 3rd week—Mazda lamps.
- 4th week—Boudoir lamps.
- 5th week—Economizing appliances.
- 6th week—Dimmers and three-in-one plugs.
- 7th week—Fans of all types.
- 8th week—Table appliances, toasters, percolators, etc.
- 9th week—Flat iron week.
- 10th week—Special sales of "odds and ends."
- 11th week—Ironing machines.
- 12th week—House wiring.

We find that concentrating on one thing at a time, like this, we not only make immediate sales but receive many inquiries as to the use and utility of electrical appliances. Having the schedule before us we know exactly what we are going to push in any week; we are never at a loss to know what to advertise, and we do not miss anything.—"Contact."

The Cleveland Fare Box Prevents Mistakes

It is the one sure method of collecting fares without possibility of mistakes or losses in any way.

THE CLEVELAND FARE BOX is an important advancement in street car service to the public in safeguarding the interests of the municipality or company, and in saving time and labor.

Write for further important facts regarding this practical and valuable means of collecting fares.

Better Merchandise is one of the Results of Advertising

It is invariably true that the best products are those that are advertised — there are written claims to live up to and a good-will to maintain.

To Obtain Safe and Satisfactory
Switch Operation Install These

POLE TOP DISCONNECTING SWITCHES

These vertical break switches (types 1100 and 2200) by gradually increasing the resistance in the rising path of the arc effectively break the arc without causing appreciable line surges. This is effected by the blades of the switches moving in the general direction of the arc.

These switches are operated by a system of levers of simple construction. All insulators are in direct tension or compression, thus eliminating any torsional strain between the different shells.

An important feature of these switches is that during both opening and closing operations, the blades always operate in the same plane as the line wire. Thus the different phases are at the same distance when opening or closing as when the switch is closed.

Possessing exclusive features of scientific and mechanical construction and operation, and giving the most efficient switch service obtainable, these switches are worth your making further enquiries. Write for our new bulletin today.

GUELPH, Limited - CANADA

The Oiling System is Automatic!

The Automatic Oiling System is another feature back of the national reputation of the Crystal Electric Washer which makes it unmistakably more attractive to the housewife.

The favorable opinion of the Crystal Washer held by the women of this country may seem offhand to be based on general impressions—but deeper investigation soon brings home the fact that it is firmly founded on an almost universal acknowledgement of the Crystal's simplicity and mechanical superiority.

Every day you are reminded of the constantly increasing interest in electric washing—you sense it in talking to the women of your own community.

If you are seriously interested in making preparations to turn this rapidly developing demand into dollars in your bank account you will be a keen reader of the New Crystal Merchandising Book—a mine of plans and ideas for the man who sells washing machines.

The Crystal Swinging Wringer

The clothes are wrung from the machine into the rinse water.

—next from rinse water into the bluing water.

—then from the bluing water into the clothes basket.

Crystal

Electric Washer and Wringer

J. C.

Refillable Fuses

4 Cartridge Type

Knife Blade Type

ALL Copper ends.

The J.C. Refillable Fuses are now in general use throughout Canada by Power Companies, office buildings, Government buildings and other large users.

The J.C. gives a sure contact.

The J.C. Refills are accurate.

The fibre tubes do not char, and are asbestos lined.

The J.C. Refillable Fuse is simple in construction and a money saver.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

"American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$3.00.

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price \$2.00.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price \$2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price \$1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price \$2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price \$2.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$6.00.

Electrical Injuries, by C. A. Laufer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Electric Power Transmission, Principles & Calculation, by Alfred Still. 2nd Edition, revised, enlarged and rewritten. Just published by McGraw-Hill Book Co., Inc. 407 pages, illustrated. Price \$3.50.

Elements of The Infinitesimal Calculus, by G. H. Chandler, M.A., Prof. Applied Mathematics, McGill University, 318 pages, cloth bound. Published by John Wiley & Sons, 1907. Price \$1.40.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price \$1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price \$1.50.

"Elements of Radiotelegraphy," by Ellery W. Stone. Recently published by D. Van Nostrand Company, 267 pages, 125 illustrations, 33 plates. Price \$2.50.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$2.00.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price \$1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

"Fuel," by C. F. Herington, recently published by D. Van Nostrand Co. 211 pages, with 84 illustrations. Price \$3.00.

"Governors and the Governing of Prime Movers," by W. Trinks. Recently published by D. Van Nostrand Company. 236 pages, 140 illustrations. Price \$3.50.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

Induction Coils in Theory and Practice, by Prof. F. E. Austin. Published this year by the author. 64 pages, illustrated. Price \$1.00.

International Library of Technology, Vol. 11.B. on Electricity and Magnetism, Electrodynamics, Electrical Resist-

ance and Capacity, The Magnetic Circuit, Electromagnetic Induction, Chemistry and Electro-Chemistry, Primary Batteries, Electrical Measurements, 585 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

International Library of Technology, Volume 14-C on Storage Batteries, Incandescent Lighting, Arc Lighting, Interior Wiring, Modern Electric Lighting Devices, Electric Signs, Electric Heating, 540 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

"Powdered Coal as a Fuel," by C. F. Herington, recently published by D. VanNostrand Co. 211 pages with 84 illustrations. Price \$3.00.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.50.

Standard Wiring, 1919 Edition, 25th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price \$1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price \$2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price \$1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.

The B.I. Hand-Book, published by British Insulated & Helsby Cables, Limited. Second edition. 448 pages, illustrated. Price \$1.00.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price \$2.50.

"The New Competition," by Arthur Jerome Eddy, 6th revised edition. price \$1.60.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price \$1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price \$1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.50.

EASILY SOLD

is what the dealers who handle the Eden have to say about it, with good profits, too, they add.

And they are right.

The sales of Eden Machines have increased by leaps and bounds during the past year. Women everywhere are being educated to the fact they need not be kitchen drudges, so they are buying Washing Machines and their preference has been

THE EDEN

the time tested machine with the all metal body, and its twenty-five points of superiority.

UNIVERSAL BUSHINGS FOR FLEXIBLE TUBING

Neat, Secure and Accessible

Nos. 1 & 3

They grip the flexible tubing securely. Can be installed in a moment by simply slipping over the tubing. Fits "knock out" tightly. Permits easy removal of flexible tubing for inspection without dismantling switch box or injuring bushing or tubing.

Nos. 2 & 4

Universal Bushings

combine function of porcelain, bushing and tape, and give the job a finished mechanical appearance. Try them and be convinced.

Approved by the National Board of Fire Underwriters

There's a Big Difference with

No-Spark Carbon Brushes

They reduce the wear on machines 90% because the lubrication lasts. Your men will know the advantage

of NO SPARK brushes over the average carbon brush.

NO SPARK brushes will not chip, split, or crumble, and by

containing lasting lubrication they provide frictionless contact, eliminate noise, and produce a permanent glazed surface on the commutator bars. Full details and prices on request.

ECONOMY renewable FUSES

are the *right* fuses to protect *your* electrical circuits—

—because they afford the right sort of protection; their reputation lends assurance that you can safely depend on them for accuracy of rating and all-round efficiency in operation.

—because they cut annual fuse maintenance costs 80% as compared with the use of one-time fuses, owing to the fact that an inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

—because it's the work of a moment to replace the link and renew the fuse.

—because a good sized stock of "Drop Out" Renewal Links always on hand represents but a small outlay.

Phantom View, Walger 2-Way

2-Way Connector

For connections, for lengthening extension wire, and for exchanging fixtures. Save money every time.

Actual Size

Walger Connectors

For faster, more efficient work, and better profits on every job.

Order these handy little time and money savers now. Use them on your next job of interior wiring—then watch the quicker, smoother and more satisfactory work you get.

Walger connectors eliminate blow torch, solder, and all the trouble incurred by using old fashioned methods.

Walger Connectors make permanent connections. They make perfect connections, the kind appreciated

by every Electrical Inspector. Simple to handle, convenient and easy to install. They save time and temper. Approved by the National Board of Fire Underwriters and Hydro Electric Power Commission for No. 12 and smaller wire.

ESTABLISHED 1849
BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamilton,
Ont.; London, Ont.; Montreal, Que.; Ottawa,
Ont.; Quebec, Que.; St. John, N.B.; Toronto,
Ont.; Vancouver, B.C.; Victoria, B.C.; Win-
nipeg, Man.; Calgary, Alta.; Edmonton, Alta.;
Sydney, N.S.

THOS. IRVING,
Man. Western Canada, Toronto.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

National Conduit Co., Limited
Toronto

Among Other Features, Ball Bearings Make the St. Louis a Much Superior Induction Motor

The usual trouble of the induction motor that has the ordinary sleeve bearing, is entirely absent in the St. Louis motor, as it is fitted with high grade ball bearings. And the bearings are so contained as to be free from grit or dirt.

Disassembled View of Motor

By the torque characteristic of the St. Louis, losses in the stator iron and copper are minimized, and there is greater starting torque on considerably less starting current.

The St. Louis motor is very strongly built, and bolted to separate base. It has exclusive construction of rotor, centrifugal switch, terminal leads, and low temperature rise.

Generation, Transmission and Application of Electricity

Curtis Publishing Company print the millions of copies of Saturday Evening Post, Ladies Home Journal and Country Gentleman on the largest printing presses in the world. All current used by the motors to drive these presses, as well as all other current used throughout the entire building, is measured by means of Sangamo Meters.

Because of their well founded reputation for sustained accuracy, ruggedness, ease and economy of installation, safety and simplicity in testing, Sangamo Meters are preferred by such large current users throughout the world. Let us send you a bulletin describing the meter for your service.

NATIONAL PRODUCTS

SHERARDIZED

SHERARDUCT

The Rigid Steel Conduit with both surfaces Sherardized and Enameled. Rust Proof and Acid Proof. Made of a high grade spellerized mild steel tubing.

Write for Bulletin 50

ECONOMY

ECONOMY Black Enameled Conduit is made of the same high grade spellerized mild steel tubing as **SHERARDUCT**, the only difference being in the protective coating. In an enameled conduit there's none better.

Write for Bulletin 50

FLEXTUBE

Interwoven — Seamless — Non-Collapsible. Inseparable and Double Compounded. Easy to fish and every foot of every coil can be used

Write for Bulletin 151

We cannot tell you *all* about *all* National Products in this limited space, but we want to call your especial attention to certain features of **FLEXTUBE** Double compounded, Non-Metallic Flexible Conduit.

It's the original seamless interwoven non-collapsible, non-metallic flexible conduit with the "roller-bearing" interior. There's absolutely no waste; every foot of every coil can be used, and it's so easy to fish that it's a pleasure for the wiremen to use it. That makes it profitable for the contractor, and its quality is such that the best interests of the owner are served. Note the construction. The seamless interwoven tubing compounded; then the protecting outer braid, also compounded—a double compounded tubing which is satisfying to those who insist upon the highest quality. Place your order for your requirements with your jobber; specify by name—**FLEXTUBE**.

An Announcement
to the
Leading
Merchants
of CANADA

The H O O
ELECTRIC SUCTION

CANADIANS, *for* CANADIANS

THE Hoover, the largest selling electric cleaner in the world, is to be manufactured *complete* in Canada, by Canadians, for Canadians.

The big new Hoover factory at Hamilton, Ontario, will be utilized in its entirety for the *manufacture*—not the mere assembly—of Hoovers. Quantity production commences as soon as the installation of equipment is completed.

This factory affords us some 30,000 square feet of floor area at the outset, with provision for third and fourth stories as soon as *your* sales require our expansion.

This represents the culmination of plans which were compelled to await the armistice. Canada has been ready a long, long time for this step.

The Hoover is leading in world sales and popularity because it is three cleaners in one, at the price of one.

It is an electric carpet-beater, an electric carpet-sweeper and an electric vacuum cleaner.

Only The Hoover *beats* . . . as it sweeps as it suction cleans.

The Hoover is now well and favorably regarded here. Publications have for years circulated throughout Canada telling of The Hoover.

Leading Canadian magazines will increase this regard for The Hoover in 1920.

Dealers will be liberally provided with publicity helps for their use.

We are now arranging for factory-to-dealer representation on the famous tried and proved "Hoover Plan" which has made *millions* for other dealers. Send for particulars.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Accurate—Rugged—Inexpensive

In factory or field, the Type S set will quickly and accurately measure resistance or locate faults. It will withstand, without detriment to its electrical qualities, the knocks which such a set is bound to get. It is of the Dial Decade Type, and therefore simple to operate.

Excellent design plus quantity production enables a low price without sacrificing accuracy—ratio coils 1/20 per cent, rheostat coils 1/10 per cent guaranteed.

The removable suspended coil galvanometer deflects a millimeter per microampere. This combination—accuracy of adjustment of coils, sensitivity of indicator, ruggedness, inexpensiveness—is found only in the Type S set.

PRICE \$75.00

"GALVADUCT"

The most perfect interior construction conduit on the market. Recognized as the standard of high quality.

Conduits Company
Limited
TORONTO

"LORICATED"

a high-class interior construction conduit of the enamelled type, proof against acid or other corrosive agents.

NO MOTOR IS STRONGER THAN ITS ROTOR

For
larger
motors

Canadian Crocker-Wheeler
design points the way
to greater efficiency.

Failure between Rotor bars and rings is entirely eliminated.

For larger motors, a solid short circuiting ring is cast welded to the Rotor bars. Each bar is positively locked to this ring and becomes solidly welded to it.

For smaller
motors

For smaller motors, cast winding construction is used, the bars and short circuiting rings and fans are all the same material and are cast in a single operation.

Canadian Crocker-Wheeler apparatus and service are available at all N. E. Co. branches as follows:
Montreal, Halifax, Ottawa, Toronto, London, Winnipeg, Regina, Calgary, Vancouver.

AT YOUR SERVICE— The Mazda Girl

EDISON
MAZDA

TUNGSTEN
LAMPS

The mission of the Mazda Girl has been to sell lamps for electrical dealers. If she has stood in your window you know how well her mission has been fulfilled. If not, why not **you** reach out for the bigger lamp sales the Mazda girl is making?

Behind this personality in your window is a service to you and to your customers that makes for steady business based on the more efficient lighting ensured by Edison Mazda Lamps.

Advertising from coast to coast has popularized Edison Mazda Lamps all over the Dominion.

No efforts are spared by us to help the electrical dealer connect his business with this nationalizing of the name Mazda.

Our advertising—national and local—window displays, etc., and the merit of Mazda lighting service to your customers should appeal to you from the standpoint of sales, prestige and profits.

Why not make further enquiries now?

HIGH TENSION EQUIPMENT

Bus Supports for Industrial Substations

Industrial Indoor 12000 Volt Substation with Unit Type "RU" Bus Supports

Type "RU"

UNIT TYPE FLEXIBILITY

FLEXIBILITY and Interchangeability are **ace** high features of "UNIT TYPE" bus bar supports. They have adjustable top and bottom fittings—an original DELTA-STAR development since 1912.

"UNIT Type supports allow the bus or conductor to be run at any desired angle to the supporting structure—thus saving engineering expense, construction costs and insuring the best bus location.

IF changes in station voltage are necessary bus supports may be made to accommodate the higher voltage by simply adding unit insulator sections—no trouble—little expense.

**7000
Combinations**

"UNIT Type bus bar supports may be assembled in 7000 combinations—a type for every requirement.

DELTA-STAR bulletins tell the interesting Unit Type story. Ask for them.

DELTA-STAR HIGH TENSION EQUIPMENT

UNIT-TYPE INTERCHANGEABLE PARTS

The Switch that makes Accidents Impossible

More and more Canadian industrial plants are replacing old-fashioned open knife switches with Square D Safety Switches because these switches are simple in construction, dependable in operation and absolutely accident-proof.

Live parts of the Square D Safety Switch are completely enclosed in a compact, pressed steel box that can be locked. Switch is operated easily and positively by an outside handle. And the Square D Safety Switch can be locked in the "off" position when work is being done on the line.

Built in two, three and four pole types in standard voltages of 125, 250, 500 a.c. and 600 volts; in capacities from 30 to 1200 amperes. Over 300 types and sizes.

Conform to the highest standards of Canadian electrical installations. Approved by the Hydro Electric Power Commission of Ontario. Listed as standard for fire and accident prevention by the Underwriters' Laboratories. Meet the requirements of the National Electrical Code of the Bureau of Standards.

Progressive, far-sighted electricians, engineers, contractors and dealers are urging the installation of Square D Safety Switches.

Write for literature and complete information now.

"IT SETTLES DISPUTES AND, IF REFERRED TO BEFORE WIRING, PREVENTS DISPUTES."

He Likes Its Cleverness

EVERY man who sees the "Franklin" Disconnecting Switch the first time, plays with it. He likes the lock—its cleverness, its snap and strength. He pulls the ring and throws the switch time after time.

The "Franklin" Disconnecting Switch is an improvement on all other switches ever made. It is a strong, heavy, handsome switch, mounted on standard "Franklin" Insulators. It is equipped with a pulling ring that opens wide two rugged brass jaws that bridge across the blade to lock it shut. The continuation of the pull opens the switch. The jaws are beveled and admit the blade when it is closed again, snapping back sharply in a positive lock. Electrical expulsion forces only tend to hold this lock more firmly in its place.

This "Franklin" Disconnecting Switch is made in all sizes to suit all conditions of operation and service. It brings you both added convenience and security. Order the Franklin next time. Write now for full details.

Use Fibre

If you need a tough, light-weight material—high in tensile, shearing and compression strength—a non-conductor of electricity—a material with a high coefficient of friction—one not affected by oil or grease—use

DIAMOND FIBRE

If you need a material that will cut, thread, stamp or machine into any conceivable shape—with little wear on tools—a material that will do almost anything but mould—use Diamond Fibre.

Manufacturers in almost every line, Engineers, Electricians, Automobile Makers, everywhere are daily finding new uses for this remarkable material. Perhaps it will help you in your business.

Supplied in sheets, rods, tubes and special shapes.

We manufacture CELERON and CONDENSITE-CELERON — two remarkable, new water-resisting materials.

We also make the well-known line of DIAMOND-F PROTECTIVE PAPERS for food products, etc.

All orders promptly filled from our Canadian Office and Factory.

5000 Ampere, 7500 Volt Indoor Type Disconnecting Switch

Why The "Three-E" Disconnecting Switches Mean Maximum Service

They combine the important advantages of Self Alignment, Perfect Contacting, and Cool Operation (even at overloads).

They are made for both indoor and outdoor service for voltages 750 to 110,000, and for various ampere capacities. Are supplied with or without locking device.

The construction and Material of the "Three-E" switches have been given due consideration throughout to insure the best results in their operation and durability. Our new bulletin describes them in full. Write for it to-day.

Centralized Control! Even a Child Can Understand and Operate It

Among the other superior features which have built up the national reputation of the Crystal is the simple centralized control.

The operation of the Crystal is easily regulated from one point by the touch of a hand.

The favorable opinion of the Crystal held by the housewives of your community is based upon a general acknowledgement of this, and a number of other very definite mechanical superiorities, such as the Crystal Swinging Wringer, the Crystal Patented Automatic Safety Release, and the Crystal Automatic Oiling System.

If you are one of those wideawake merchants who are alive to the constantly increasing interest the Woman feels in electric washing you will find some real meat in the new Crystal Merchandising Book—an outline of the plan other dealers are using to turn this demand into actual profit.

A Prosperous New Customer for the Electrical Contractor-Dealer

The farm lighting plant is proving a close second to the automobile in popularity among progressive farmers. Hundreds of thousands of these outfits have been sold within the past few years and it will not be long until every prosperous farm is provided with electric service.

A wonderful opportunity for new business has been created for the electrical dealer. The modern farmer has the money to buy what he wants and everyone who buys a farm lighting plant is sure to want electric motors, fans, heating devices, vacuum cleaners, washing machines, etc. The owner of a lighting plant soon learns that he is not getting more than 50% service from his plant if he is not utilizing the power possibilities of his plant as well as the lighting service.

The dealer will find every owner of a farm lighting plant an especially good prospect for motor sales.

There are a multitude of laborious tasks about the farm and country home such as pumping the water, turning the cream separator, chopping feed, shelling corn, turning the fanning mill, grindstone, churn, washing machine, etc., which are performed quickly and with almost no effort at all when an electric motor is used. The dealer

who goes after this business can make a substantial and profitable increase in his sales.

Robbins & Myers Motors for service on farm lighting plants are made in styles and sizes to meet every need on the farm. They are described in a bulletin which will be sent to any dealer on request. Ask for a copy of the bulletin and samples of the advertising folders we furnish to dealers with their imprint to aid them in getting farm motor and fan business.

KEYSTONE Car Specialties

Operating cars at night without efficient headlights or illuminated destination signs is not economy.

Cars equipped with "Golden Glow" Headlights and Illuminated Car Signs are attractive, safe, more efficient, and above all, are appreciated by the riding public.

Your patrons, better than anyone, realize the safety value of efficient headlights.

The bright, illuminated sign is always an inducement to ride.

"Golden Glow" Headlights and Illuminated Signs are perfect in every detail. They are a part of the broad line of well-known Keystone Specialties.

No. 23

Electric Welding An Important Commercial Asset

When the United States finally decided to enter the war there were in her different ports about 290,000 gross tons of interned German ships. These ships, it will be remembered, had been badly damaged by the Germans before being surrendered and, in several cases, the work of destruction was deemed to be so complete that the parts were labelled by the inspectors—"cannot be repaired." In any case it was estimated that at least a year and a half would be required to make such repairs as would be possible or advisable.

The war was raging, however, and the need of ships was urgent. An arc welding firm was given the opportunity of inspecting the wrecked parts and was consulted as to the advisability of using the electric arc to effect the repairs. It was quickly decided that the repairs could be made by this means and several gangs of men were set to work to cut and fit mechanical patches and weld them into place. In five and one-half months all of these ships were again sailing the seas at top speed, with full cargoes, carrying soldiers and ammunition to France.

The above statement of an outstanding victory of the arc welding machine over all other possible methods of repair furnished the climax to a most interesting paper on "Electrical Welding," presented before the Toronto section of the American Institute of Electrical Engineers on Friday evening, November 21. The paper was presented by one of the local members, Mr. F. K. D'Alton, of the Hydro-

electric Power Commission Laboratories, and was illustrated by slides. In his treatment of the subject, Mr. D'Alton spoke first of the different non-electrical methods of welding. This was followed by a detailed account of the spot-welding machine, in which attention was drawn to the speed with which work can be done and, by illustrations, to the latest improvements in design. Finally the speaker outlined the whole operation of electric arc welding. He pointed out as matters of special importance the various points wherein the operator must be skilled, and the common troubles, with their causes. The theory of all the latest designs in arc welding equipment was covered, noting their limitations and drawing comparisons between welding by the arc and oxy-acetylene gases.

An interesting and quite unusual feature of the evening was the cartoon which Mr. D'Alton flashed on the screen at the conclusion of his lecture. This represented the Prince of Wales, who has just concluded such an auspicious visit to Canada and the United States, using his arc-welding equipment to bind together more closely these two nations, and illustrates John Bull as making a bid for the quick return of the Prince so that he may try out his welding machinery on Ireland.

Our present issue contains the first half of Mr. D'Alton's paper, which we consider one of the most complete and up-to-date treatises that has been published on the subject.

Montreal Planning An Electric Show

The question of an electrical show for Montreal was briefly discussed at the Montreal Electrical luncheon on November 12. Mr. P. T. Davies, the chairman, pointed out that it had been suggested that the next convention of the Canadian Electrical Association should be held in Montreal, and that an electrical show could be organized in connection with it. There had not been an electrical show in Montreal for many years, and the question of holding one was worth consideration.

A pessimistic picture of labor conditions in Australia was given by Mr. H. S. Bare at the luncheon on November 19. Mr. Bare spent five months in Australia, where he visited on business matters. The outstanding difficulty there, he said, was labor trouble—there was a clean-cut antagonism between capital and labor. One consequence was that opportunities for manufacturing were poor, and Australia imported enormous quantities of goods from the United States, and Canada, Great Britain having fallen behind owing to the war. Manufacturing was not carried on to anything like the extent as in Canada; "go slow" was the policy of the working classes in Australia, and naturally this affected production. "Australia for the Australians" was a favorite motto, and this view tinged the attitude of the people. There were good openings for Canadian trade in Australia, and if a preferential tariff was adopted it should result in a very large number of orders coming here. As it was, Canada was doing a fair amount of business with Australia, and he had noticed on the streets the products of the Eugene Phillips Electrical Works, Ltd., of Montreal. The climate was extremely warm, with the result that there was little heating of the houses, except by electrical heaters, which were freely used. There was a good market for cheap, reliable electrical heaters, which could be easily packed for transportation.

Speaking of business methods, Mr. Bare stated that trade must be done through the jobbing houses. Business men were keen to get prices in order to compare them, but generally it was necessary to convince business men

that you had something better and cheaper before they would make a change. There was keen local competition in the selling of machinery. It was useless for a traveller to try to sell from catalogues, the buyers wanted to see samples. The methods of the big jobbing houses were entirely different to those in Canada; for example, there were no selling organizations such as we were familiar with, the business firms waiting for trade to come to them rather than seeking for it.

Mr. Bare spoke in praise of some features of Australian life, emphasizing the splendid civic improvements in Sydney. The railway tracks were solidly built, the stations imposing and very substantial so far as the exteriors were concerned, but devoid of the comforts and conveniences of Canadian depots, in the interiors.

Water Power in Alberta

The Commission of Conservation is reprinting, for distribution, a most interesting paper on the subject, "Power in Alberta," which was presented before the recent Calgary Industrial Council, by Mr. James White, assistant to chairman, Commission of Conservation. The article deals with power under the triple heading—water, coal and natural gas.

Alberta has a very fair share of water power, but, unfortunately, the more powerful falls are some considerable distance from the present industrial centres. The following table indicates the head, estimated minimum horsepower, and approximate location of all the falls of 5,000 h.p. and up.

WATER POWERS IN ALBERTA HAVING AN ESTIMATED MINIMUM CAPACITY OF 5,000 H.P. OR OVER

Site	Head, feet	Estimated minimum h.p.	Distance from principal market and cognate data*
Bow River:†			
Radnor.....	44	8,000	25 miles from Calgary.
Ghost.....	50	9,000	30 miles from Calgary.
Mission.....	47	8,000	35 miles from Calgary.
Bow Fort.....	66	11,000	38 miles from Calgary.
Horseshoe fall.....	70	12,000	42 miles from Calgary.‡
Kananaskis fall.....	70	12,000	45 miles from Calgary.‡
Elbow river:			
Near Cañon creek.....	225	5,000	30 miles from Calgary. Other scheme using head of 500 feet also possible.
North Saskatchewan river:†			
Rocky rapid.....	85	28,000	65 miles from Edmonton. Would require a dam 85 feet high.
Athabasca river:			
5 m. above Mountain rapid....	15	7,000	220 miles from Edmonton.
Rock rapid.....	12	5,000	220 miles from Edmonton.
Crooked rapid.....	13	6,000	220 miles from Edmonton.
Long rapid.....	28	12,000	220 miles from Edmonton.
Middle rapid.....	20	9,000	215 miles from Edmonton.
Boiler rapid.....	25	11,000	215 miles from Edmonton.
Grand rapid.....	54	22,000	200 miles from Edmonton.
Pelican rapid and rapid above..	17	7,000	165 miles from Edmonton.
Baptiste power.....	80	12,000	150 miles from Edmonton.
7 miles above Baptiste river....	42	6,000	150 miles from Edmonton.
Peace river:			
Vermilion fall and rapid.....	26	20,000	340 miles from Edmonton.
Peace Cañon rapids**.....	225	94,000	380 miles from Edmonton. Would require a flume or conduit about 9 miles long, if developed at one site.
Slave river:			
Lower Fort Smith Rapids power	48	128,000	450 miles from Edmonton.
Upper Fort Smith Rapids power	69	184,000	445 miles from Edmonton.

* The mileages given in this column are air-line distances and, in most cases, are only given to the nearest five miles. As a rule, the transmission line would be at least 10 per cent longer.

† The figures for the North Saskatchewan and Bow rivers are for regulated flow. For the Bow, the minimum, with unregulated flow, is less than one-half the figures given.

‡ Calgary Power Co.'s hydro-electric plant.

** In British Columbia.

The total low power potentiality of the water powers of Alberta is estimated at 450,000 h.p. and developed water power aggregates 33,000 h.p. The report points out that this table does not indicate any great resources in the well-settled portions of the province, and that it is necessary to consider measures to supplement or to replace power from

water. Unfortunately, too, there is little natural provision for water power storage. The streams of Alberta do not drain large lakes nor is it possible, in general, to construct large artificial reservoirs, except at heavy cost. In Alberta, numerous coal resources, however, Mr. White says, supplement for the deficient power during the low water months. Auxiliary steam plants could be installed to take care of the peak loads.

The author makes a general comparison between the relative cost of installation and operation of steam power and water power plants, and quotes authorities to show the error of the generally popular belief that water power is inherently cheaper than steam power. As a matter of fact, their relative costs are dependent upon a number of considerations, and in many instances, steam power is cheaper than water power.

The quantity of coal in Alberta is, of course, almost unlimited. This province contains 87 per cent. of the coal of the Dominion, practically the whole settled portion of the province being underlain by this valuable fuel. The paper points out the possibilities in the establishment of large centralized plants and states that "one giant unit of 80,000 h.p., such as is now operating in a street railway power house in New York, could supply nearly the whole of the present power consumption of the principal industries of the province of Alberta."

This idea of centralization of generating plants becomes all the more attractive in view of the actual developments in long distance transmission. In the province of Ontario, transmission at 110,000 volts has reached a radius of approximately 300 miles, and in the United States, with still higher voltages, still wider areas are being supplied. There are apparently great possibilities for distribution of power in Alberta, when her water powers have been supplemented by her coal resources.

Electric Light Increases Egg Production

A very interesting report of experiments made in the Poultry Plant of the Manitoba Agricultural College, Winnipeg, using electric light as a factor in increasing winter egg production, has just reached us. The figures are surprising and indicate that, for a comparatively small additional expense, production can be increased out of all proportion.

The experiments were performed with 12 pens of 25 single comb White Leghorn pullets, uniform in age, size and condition. Six of these pens were given artificial light and six pens no artificial light between the dates November 15, 1918, and April 15, 1919. Where the extra illumination was used, lights were turned on at dusk in the evening and the pens were kept lighted until 10.30. In the morning the lights were again turned on at 7 o'clock until daylight. The pullets in the lighted pens were not given their evening feed until between 7 and 8 o'clock.

The following figures show what effect the lighting had and how soon after starting the experiments effects were noticeable. The figures date from the week beginning October 27, although, as already stated, the extra light was not commenced until November 15.

It is noticeable that a very marked increase in production is shown the very first week the extra lights were used, that is the week beginning November 17. It is seen that this advantage was held consistently throughout, until the week beginning March 9. From then on the advantage rested slightly with the non-lighted groups.

Summing up the total production it will be seen that the 6 groups in the artificially lighted pens produced 13,544 eggs throughout the total period of the records, as against 11,661 for the non-lighted groups, a difference of approximately 157 dozen, or more than a dozen per fowl. This is

Week ending		150 Pullets under Artificial Lighting Conditions	150 Pullets under Ordinary Daylight Conditions
October	27	220 eggs	224 eggs
November	3	224 "	198 "
"	10	210 "	202 "
"	17	373 "	249 "

"	11	466 "	578 "
"	18	500 "	595 "
"	25	462 "	473 "
June	1	270 "	277 "
"	8	299 "	310 "
"	15	412 "	363 "
"	22	274 "	319 "

not the most important point to consider, however. The months of November, December, January and February are the months of abnormally high prices and totalling the production in the two cases, beginning November 10 and ending March 9, it will be seen that the production of the artificially lighted groups was 6,587, as against 3,851, a difference of 228 dozens. Fresh eggs in a number of Canadian cities are to-day quoted at \$1.00 per dozen and in Toronto have already reached \$1.30; this, at a time of the year when the highest price has not generally been reached. Under such conditions the added production of 228 dozens from 150 fowls shows a very marked advantage in favor of extra lighting.

It will be seen further that for the week beginning March 9th the "No Light Pens" for the first time laid more eggs than the "Lighted Pens." This is accounted for by the fact that the days were then getting longer and the electric light was of no more use. The shorter the days, the greater the value of the light. Even better results than these could be obtained were the lights turned on earlier in the fall. As early as October 1st would be all right for Western conditions in the opinion of the Department. The effect of a drop in temperature is also clearly seen in the detailed record above. The weeks beginning December 29th and January 5th show what will occur during a cold snap. For three weeks in February and two weeks in March the same thing happened.

The summary which follows will show, further, the cost of the feed for both "Lighted" and "No Light Pens," and also the number of eggs produced by both lots from November 15th to March 1st. The cost of producing a dozen eggs, and also the number of ounces of grain required to produce a dozen eggs is shown.

Lighted Pens. Feed Account.

Grain, 1778 lbs. at 3c per lb.	\$ 53.34
Oats, 1663 lbs. at 2½c per lb.	41.58
Milk, 1440 lbs. at 25c per cwt.	3.60
Bone, 36 lbs. at 5c per lb.	1.80
Shell, 152 lbs. at 1½c per lb.	2.28
Grit, 47 lbs. at 1½c per lb.	.71

Mash, 120 lbs. at 2½c per lb.	3.00
Cabbage, 500 lbs. at 1c per lb.	5.00

Total cost of feed	\$111.31
Light cost	\$11.50
Eggs laid	6,324
Cost per dozen (including light)	21.1

It took 9 oz. grain to produce one egg.

No Light Pens. Feed Account.

Grain, 1700 lbs. at 3c per lb.	\$ 51.00
Oats, 1564 lbs. at 2½c per lb.	39.10
Milk, 1075 lbs. at 25c per cwt.	2.69
Bone, 36 lbs. at 5c per lb.	1.80
Shell, 131 lbs. at 1½c per lb.	1.97
Grit, 70 lbs. at 1½c per lb.	1.05
Mash, 120 lbs. at 2½c per lb.	3.00
Cabbage, 500 lbs. at 1c per lb.	5.00

Total cost of feed	\$105.61
-------------------------	----------

Eggs laid	2,557
----------------	-------

Cost per dozen	33.6
---------------------	------

It took 14 oz. grain to produce one egg.

We are indebted for the information given in this article to Mr. M. C. Herner, Professor of Poultry Husbandry, Manitoba Agricultural College, Winnipeg, Man.

N.E.L.A. Courses Open to All

In accordance with its customary liberal policy the National Electric Light Association has opened for subscription all of its educational courses at the association prices to whosoever wishes to subscribe. Up to the present time subscriptions to these courses have been confined to its members, but due to the continued demand from allied industries, colleges, and schools for use of these courses, the Public Policy Committee and the Executive Committee at its meeting on October 2nd approved a resolution opening subscriptions to all who may apply, believing that a wider distribution of these courses would be of general benefit to the industry as a whole. The N. E. L. A. courses are four in number; the course in Practical Electricity, and Commercial Engineering course, both published by the Commercial Section; the Elementary Accounting course, and the Advanced Accounting Course, published by the Accounting Section. These courses have been very popular within the Association, and undoubtedly will prove their popularity in value to the industry in general.

The Prince of Wales has been so successful on this continent that John Bull wants him to try his apparatus on Ireland.—Cartoon shown at Mr. D'Alton's lecture on Electric Welding.

Some Interesting Data on Cost and Operation of Transmission Lines

Owing to the great advance in cost of labor and material, the cost of transmission lines have greatly increased over those of pre-war conditions. The present approximate cost for some transmission lines in Ontario may representatively be cited as follows:

A main line 'heavy duty' steel tower transmission line, carrying two lines at 110,000 volts, such as the latest type of line used by the Hydro-Electric Power Commission of Ontario between Niagara Falls and Toronto, with 66-feet right-of-way, the equivalent of 4-0 copper conductors, telephone service, and all items of expense, would be about \$17,000 per mile.

A 110,000-volt line, single circuit, supported by wood poles, with 66 feet right-of-way, and the equivalent of 1-0 copper conductors, and telephone line, would be about \$8,500 per mile. If pole rights alone are secured the cost might be reduced to about \$5,500 per mile.

A 44,000-volt, wood-pole line, with steel conductor and telephone line on same poles, could be erected for about \$3,000 per mile, but, if there were considerable rock excavation for poles, this cost might easily be doubled.

A 22,000-volt line, carrying one circuit of approximately the equivalent of No. 1 copper conductor and with telephone line, would cost about \$3,500 per mile.

Smaller lines of about 4,000 volts, with equivalent of No. 4 copper conductors, have, under present conditions, been built for about \$2,000 per mile.

At the present time, a transmission line from Winnipeg to Portage la Prairie is under construction. It will be

LINE LOSSES

Name of company	Termini	Voltage at generating end	Distance	Loss per cent
			Miles	
Shawinigan Co.....	Grand'mère to Montreal...	100,000	94	10
Can. Light & Power Co.	St. Timothée to Montreal..	44,000	27	8
Laurentian Power Co.	St. Féréol to Montmorency	50,000	24	5
Sherbrooke Municipal	Weedon to Sherbrooke.....	45,000	30	13
Hydro-Electric Power Com.	Napanee to Kingston.....	44,000	30	10
Toronto Power Co....	Niagara Falls to Toronto..	60,000	80	20
Dom. Power & Trac-tion Co.	Power Glen to Hamilton..	44,000	33	6
Winnipeg Municipal..	Pte. du Bois to Winnipeg..	66,000	78	20
Calgary Power Co....	Kananaskis to Calgary....	50,000	50	7½
West Kootenay Power and Light Co.	Bonnington to Greenwood..	60,000	82	10
B. C. Electric Ry. Co.	Jordan plant to Victoria..	60,000	43	16

60 miles long, of steel tower construction and will have an ultimate capacity of 20,000 kw. The immediate installation is of one circuit line of No. 0 aluminium cable which is estimated to carry 5,000 kw., at 66,000 volts with a 3 per cent. drop in voltage at Portage la Prairie; or 10,000 kw. with 15 per cent. voltage loss. The second circuit will be installed as soon as the demand for power warrants it. The estimated cost is \$4,600 per mile, which includes sub-stations at Winnipeg and Portage la Prairie. As it follows the highway no right-of-way was purchased except at a few points where the line is on private property.

Extensive Work in Saguenay District

Extensive improvements in connection with the pulp and paper industries are being carried out in the Saguenay district, P. Q. Fraser, Brace & Co. are engaged in constructing a dam and other works for the development of a power mill at Saguenay, for Price Bros. The Chicoutimi Pulp Company are adding to their power development, at Chicoutimi, not only for power purposes for the ground wood mill, but for extra lighting for the town. J. G. White & Co., New York, are building extensive wharves at Ha-Ha Bay, which will probably be electrified. At Kenogimi, Price Bros. have erected a theatre and club house for the men at a cost of \$50,000.

The Diamond State Fibre Co. of Canada

The Diamond State Fibre Company of Canada, Limited, have opened up an office and factory at 455 King Street West, Toronto, for the manufacture of the Diamond State Fibre Company's well known insulating fibres. These include the Diamond insulating fibre, the Disfco Insulating fibre and the genuine horn fibre, the latter product being exclusively manufactured by this company. We are advised that the Canadian company will manufacture these lines in Canada beginning December 1, and carry a complete stock of sheets, rods, tubes, bushings, washers, etc. This is the first factory of its kind in the Dominion. The Canadian business will be in charge of Mr. T. E. Webster, as general manager.

The Quebec City Council have given final reading to a by-law empowering the Quebec Railway, Light, Heat & Power Co. to increase the street railway fares to seven cents—four tickets for 25c, 17 tickets for \$1; 3c. cash fare for children not in arms, or 8 tickets for 25c.; eight tickets for 25 cents to school children up to 16 years; six tickets for 25 cents for employees, good between the hours of 6 and 8 a.m. and 5 and 7 p.m. Under the proposed contract, the company will have to construct certain new lines and extensions.

COST DATA OF TRANSMISSION LINES

Line	Year built	Length, miles	Voltage	Cost per mile	Remarks
Canadian Light and Power Company, Montreal.	1911	27	44,000	\$ 11,000	2 circuits of 2-0 copper, steel towers.
Laurentian Power Company, Quebec.	1916	24	50,000	6,875	2 circuits of 1-0 copper, steel towers.

Electric Spot and Fusion Welding

A Detailed Resume of the Progress and the Present Status of This Valuable Commercial Art—Illustrations of Various Types of Joints

By F. Keith D'Alton*

The processes of electrical welding are matters of growing interest to mechanical and electrical engineers. The neatness and strength of the welded part, together with the speed, cost and certainty of the operation are points which specially appeal to the mechanical engineer. The electrical engineer appreciates the fact that there is a field opened up for special equipment which he may design and standardize, and for which there is a gradually increasing demand.

Welding may be defined as a process in which metals are fused together when melted under the influence of intense heat, with, possibly, the application of pressure as well. Classification may be made as follows:

Autogenous Welding—includes the processes where the metals to be welded are raised to so high a temperature that they flow together to form a weld without pressure being used.

Forge Welding—the forerunner of the modern welding processes. The metals are raised sufficiently high in temperature that they may be joined by applying a pressure and hammering on the anvil. The heat may be obtained by any one of several suitable methods.

Oxy-Acetylene Welding—covers that branch of autogenous welding wherein the heat is produced by the chemical combination of oxygen and acetylene gases.

Thermit Welding—another branch of autogenous welding, not greatly used, wherein the heat is produced by another very rapid chemical combination.

Electrical Welding—is a divided branch and comes under the classification of both autogeneous and forge welding.

Theoretically it is possible to weld metals, but practically this is not so. Simply causing metal to melt and to run into a joint or part to be filled, does not necessarily produce a good weld. Brass and bronze with a low (3%) percentage of zinc can be successfully welded if care be taken, but brass with a higher percentage of zinc is apt to be porous. It is difficult to weld aluminium, since this element oxidizes at a lower temperature than its melting point, and the weld will most surely contain a considerable percentage of the oxide of the metal. These metals may be classified as being those of low melting point compared with the grades of iron and steel commonly used. The metals best suited for welding are—boiler plate, wrought iron, grades of steel for fabricated shapes in general commercial work.

Since by far the greater amount of welding is done on iron and steel in the three forms mentioned above, and as the behavior of the different elements existing in these grades depends very much on conditions which are subject to variation, but under the control of the operator, we shall confine our further remarks to these metals which we most frequently meet.

Chemical Elements in Iron and Steel

In the various forms of iron and steel we find a number of well known chemical elements, each of which makes its presence felt by giving some characteristic to the metal:

Cast iron may be in the form of gray or white iron, depending upon whether the metal is cast in sand or in cold metal moulds. Due to its brittleness and low tensile strength, it is difficult to weld cast iron by any process; even under most favorable conditions the results are always un-

certain. Malleable castings are simply annealed white iron castings. The annealing frees part of the carbon, but as this effect is largely at the surface, it does not improve the condition of the metal for welding.

Wrought iron is metal which has been given mechanical treatment while cooling. This mechanical treatment squeezes out the slag, gives the metal a finer grain and increases its toughness. The quality of wrought iron is a function of its purity.

Steel produced by the Bessemer or Open Hearth process may contain, in different proportions, any or all of the following elements—carbon, manganese, nickel, chromium, vanadium, and tungsten. The physical characteristics are determined by the percentage and kind of impurities present.

Carbon is present in varying proportions in all grades of iron and steel. The proportion of free carbon is comparatively large in grey cast iron. In white iron the proportion of carbon is approximately the same as in gray iron, but it is in the combined state. The annealing to produce malleable castings has the effect of freeing the carbon, producing purer iron. In steel the carbon content determines the tensile strength.

Phosphorous is undesirable and causes brittleness when the metal is cold. Sulphur is equally undesirable as it causes brittleness when the metal is red hot, or hotter. Silicon causes brittleness, but gives the metal the power to resist abrasion; one half of one per cent. silicon is a maximum. Manganese may be present up to one-fifth of one per cent; increase in manganese increases the ductility and toughness and prevents the iron from combining with phosphorus and sulphur. Further increase up to 5.5% causes brittleness, but additional increase up to 10% makes the steel ductile again but hard.

Nickel increases the tensile strength without lessening the elasticity, and gives the steel a certain resistance to combining with atmospheric oxygen; nickel steel, therefore, does not rust easily. Vanadium, in effect, is similar to nickel. Chromium produces results similar to manganese. Tungsten causes the steel to retain its hardness at high temperature.

Having now considered some of the principal features of iron and steel which must be taken into account in welding, we will consider the practical processes themselves. It will be necessary to re-classify these various methods according to the source of heat. The most common processes naturally fall into two classes—gas welding and electrical welding.

Gas Welding

In this process the heat is obtained by the combustion of acetylene gas with oxygen. These gases are mixed in a suitably designed torch which is light in weight and held in one hand by the operator. The other hand controls the feeding-in of the filler material. The oxygen gas is supplied in tanks at a pressure of 1,800 pounds per square inch, while the acetylene is supplied in solution in acetone under a pressure of 250 pounds per square inch, and contained in tanks of somewhat lighter design than those used for oxygen.

Some manufacturers advocate the low pressure system using gas in the torch, at a pressure of about 13 ounces per square inch, while others recommend the high pressure sys-

*Before Toronto Branch A.I.E.E. Nov. 21.

tem in which the pressure is about 15 pounds per square inch. Each of these methods has its advantage over the other. It is claimed that the low pressure system makes more efficient use of the gases in the tanks, being able to use a larger percentage of the total gases purchased. It also permits the use of a portable gas generator for producing acetylene. The high pressure system requires such high pressure at the tanks that they must be returned to the supply station to be refilled there.

Acetylene under a pressure of two atmospheres is considered to be highly explosive on account of the compound being easily disintegrated and liable to be impure, due to the presence of oxygen in the acetylene tank.

The high pressure system requires a reducing valve which frequently results in fluctuations in the pressure of the gases. Excess of oxygen, which is usually a condition of the low pressure flame, results in burning the metal, whereas

Fig. 1—Single Spot Welder—Large reactance in loop.

an excess of acetylene results in adding carbon to the metal. It is quite possible, therefore, that due to the oscillating motion which the operator gives to the torch in making a weld, one side of the added material may be burned while the other side is carbonized. The metal added would then not be uniform and the result might be a poor weld. The flame must be neutral and as steady as possible. The high pressure system will work much more rapidly than the low pressure system, cutting at a faster rate with a narrower cleaner cut.

Both systems of gas welding produce narrow and very hot flames (6300°F) which are especially adapted to the cutting of metal. In welding, however, a filler must be added and the composition of the material in the filler, to a large degree, determines the effectiveness of the weld.

The process of gas welding, the chief competitor of electrical welding, having been described in principle, let us now study in more detail the processes in which the heat for welding is produced electrically. There are two distinct branches, namely, "Spot Welding" and "Fusion Welding."

Spot Welding

This is a process dependent upon both heat and pressure, wherein the heat is produced by an electric current passing through the contact resistance between two pieces of metal and the electrodes.

The electrodes are usually of copper which close on the sheets to be welded and through the electrodes the pressure is applied. This process can be used for all metals. It produces a weld which is much stronger than riveting and nearly as strong as the metal itself. Moreover, one spot weld makes a rigid joint, whereas one rivet allows the parts to rotate about it. The electrical spot welder is largely limited to small-size jobs on account of the "reach" of the equipment. By the term "reach" is meant the distance which the upper electrode will extend over the plates being welded. This determines the size of job which can be done on a particular spot welding machine.

This process is much faster than rivetting and the results are more lasting. It does not require an experienced operator as the welding simply consists in placing the plates in position in contact with the lower electrode, then bringing the upper electrode down on top of them and turning on the

electric current. The movement of the upper electrode is controlled by a lever, a little additional pull downwards on this turning on the current. The current is adjusted at the beginning of the operation and is given a value suitable for the particular work which is to be done. Compared with ordinary forge welding, the action is much more speedy and the metallic oxides, so troublesome to a blacksmith, are eliminated.

The spot welding machine has not been overlooked in the progress of recent years; various radical changes and improvements have been made. While either alternating or direct current may be used, the ease and efficiency with which alternating current may be transformed into currents of high amperage render it most suitable.

In the single-spot welder the power is supplied through a contactor to a transformer contained in the machine. The secondary circuit of this transformer consists of only one turn which includes in the loop the electrodes and metal being welded. On account of the extent of the "reach" the secondary circuit becomes a reactance loop of greater or less length, see Fig. 1. Due to the large currents in this loop the reactance becomes an objectionable feature and, in order to overcome this difficulty, the duplex-spot welder was brought out.

In the duplex-type of welder, Fig. 2, the secondary reactance loop is reduced to a minimum and is independent of the reach of the machine. Two complete identical equipments are placed, one above and one below, the plates being welded. Each equipment has two parallel electrodes and contains one half of the secondary loop. The upper electrodes are brought down on to the work in such a position that they are directly opposite the electrodes of the lower equipment. The secondary currents then circulate downwards through the plates on one side and up on the other side, thus giving higher efficiency by avoiding a long loop with its additional resistance and reactance. Also, while the

Fig. 2—Duplex Spot Welder—Minimum reactance in loop

equipments are identical, currents of any appreciable value will not pass horizontally in the plates.

Line welding is a branch of spot welding producing a joint similar to a line of rivets, but stronger and water tight.

Electric Fusion Welding

Both welding and cutting by means of the electric arc will be considered under this heading. In these processes, the electric arc is used merely for the production of a high temperature ranging from 6300°F. to 7300°F.

Arc welding is specially suited to such work as (a) joining of plates or broken parts; (b) building up parts worn by use; (c) filling blowholes in defective parts; (d) caulking joints.

Before proceeding to make a repair or to build up worn parts by the electric arc welding process, the material must

be prepared for the operation. All scale, grease and dirt must be removed from the part on which the welding is to be done in order to avoid impurities in the weld. For this, a file, chisel, wire brush or sand blast may be used. The material must then be shaped in such a way that the new metal being added will touch the original metal over a fairly large surface giving opportunity for good fusion to produce a strong weld.

For electric arc welding, both direct current and alternating current are used. As these differ widely in the nature of the equipment used, and more or less widely in the

Fig. 3—Butt weld.

results obtained, it seems advisable to discuss each separately, taking first the one most commonly used, namely, direct current.

Having prepared the material in the part to be welded, the two leads from the direct current welding panel are brought along and the positive lead connected securely to the piece of metal on which the work is to be done; the "job" then becomes the positive electrode. The negative lead is connected to the "electrode holder," a device for gripping a piece of welding wire or stick of carbon, and sufficiently light in weight to be manipulated with one hand by the operator. The carbon electrode demands a much more massive holder than the metallic electrode on account of the greater heat generated with the carbon. This negative electrode, either carbon or metallic, will hereafter be referred to simply as the "electrode."

The polarity as just mentioned is a very important point. It is estimated that seventy-five per cent. of the heat developed by an arc is at the positive electrode, the remainder

is used, having the polarity right prevents unconsumed particles of carbon being carried into the weld and causing hardness. A reversed polarity gives an unstable arc and the added metal is a spongy deposit with a hard and scaly surface.

Having made certain that the polarity of our connections is correct, the arc is now struck by touching the electrode to the piece of material on which the operation is to be performed, and pulling away again a short distance, establishing the arc. If a carbon electrode be used a filler will be required and must be fed into the weld in just the same manner as with the oxy-acetylene process. When metallic electrodes are used the electrode itself acts as the filler. The operator moves the electrode over the work at a distance of about 3/16 inch. The fusing electrode (or filler) gradually fills up the space attaching itself to the parent metal and becoming a part of the original material. An extra supply of metal may be added and machined down to desired size when cooled. As soon as the metal in the weld begins to cool it should be hammered in order to reduce sponginess, to qualify the strain and to give the metal a finer grain.

Welding may be done at any angle, on the horizontal, vertical or overhead. While the British Admiralty avoid overhead welding unless absolutely necessary, a considerable amount of it is done in America. It is claimed to be merely a matter of training operators. The operation on overhead work is similar to normal welding except that there is some difficulty in holding the electrode steady in the cramped position usually required. With a steady arc length however, successful work can be done. The carbon electrode is not applicable for overhead welding.

Carbon Electrodes

Where welding or cutting is done with carbon electrodes the current used may range from 100 to 1000 amperes, and the voltage required will be from 40 to 50 volts. The diameter of the electrode is suited to the current used according to the following table. The length of the carbon does not usually exceed 12 inches:

Diameter of electrode	Maximum current
1/4 inch	100 amp.
1/2 "	300 "
3/4 "	1000 "

In cutting with the carbon arc it is advisable to use the

Fig. 4—Lap weld.

Fig. 5—Strap weld.

Fig. 6—Tee weld.

being generated at the negative electrode and in the vapor of the arc itself. The piece of metal being repaired has usually a much higher thermal capacity than the electrode, so that by properly connecting the leads we get the heat developed just where it is required, and in sufficient quantity to keep the temperature of the metal up to melting point in spite of the fact that heat is lost by conduction in the material. Also it reduces the rate of melting of the electrode material giving the welder better control of the operation. In a case where a carbon electrode

heaviest current possible. By doing so the cutting speed is increased and labor cost reduced in consequence. The speed of cutting increases roughly in proportion to the current used. There are several grades of carbon used for electrodes:—(a) The plain hard carbon for ordinary use; (b) copper coated carbon with high conductivity; (c) graphite rods, soft, for use on high current density. The latter two grades are more or less special and may be used by certain operators who prefer them.

In welding with these electrodes, the filler does not tra-

verse the arc but is fed in by the operator, melted by the arc and deposited in the weld. Scrap material should not be used for filler as it introduces impurities into the weld. The arc will be more steady if the end of the carbon be tapered. For this reason carbons supplied are usually tapered at the arc end but ordinary flat ended carbons may be procured.

There are some points in connection with the use of carbon electrodes for welding which tend to favor the use of the metallic electrode in their stead. These are:—(a) Liability of carbon being carried into the deposited material thereby reducing ductility and, (b) difficulty of obtaining good fusion due to the tendency of deposited metal to overlap on the original metal; (c) requiring more skill to manipulate than the metallic electrode; (d) very hot arc causing discomfort to the operator and resulting in lower efficiency; (e) greater cooling stresses are developed since larger areas of material are heated.

Metallic Electrodes

These electrodes consist of rods of fairly pure iron or mild steel about 1/16 to 3/16 inches in diameter, the choice of diameter being made in accordance with the thickness of the plate. The current used ranges from 75 to 180 amperes, with a voltage of 15 to 30 volts. The voltage used does not affect the composition of the weld.

The following table gives the currents and electrode diameters used in joining steel plates:

Thickness of Plate	Maximum Current	Diameter of Electrode
1/8	75	1/16-3/32
1/2	125	1/8
5/8	155	5/32
above 5/8	175	3/16

It is claimed that the metallic electrode gives greater speed in the deposition of metal than the carbon electrode. With the mild steel electrodes, containing various elements such as carbon, nickel, silicon, vanadium and chromium, one is inclined to think that these metals will all be found in the deposited metal, but oxidation is more or less complete with the result that these metals are almost completely oxidized away, leaving the sulphur and phosphorus, which are usually present, in the same proportions as in the original electrode. The deposited metal is a fairly pure cast steel with only traces of the elements contained in the electrode ma-

Fig. 7—Plug weld.

terial. Too much oxidation of the original filling-in material will produce porous, spongy and generally unsatisfactory welds. The silicon and manganese, acting as powerful reducing agents tend to prevent excessive oxidation of the electrode material.

Some manufacturers produce a covered electrode making certain claims on its behalf. In cases where these are used, the covering melts with the electrode material and forms a protective slag on the surface of the deposited metal, thereby keeping away the oxygen of the atmosphere and

preventing oxidation. The British Admiralty use the coated electrode for all welding work. It is American practice, however, to use the bare electrode with a fairly large percentage of manganese which tends also to prevent oxidation by reducing any oxide formed. The Emergency Fleet Corporation of the United States have clearly demonstrated that bare electrode welding produces just as satisfactory results as those obtained with flux covered electrodes, and they claim, therefore, that the use of the expensive flux covered electrode is not justified. In Canada, the bare metallic elec-

Fig. 8—Tack weld.

trode is used most extensively, manufacturers and welders being inclined to think that the flux coating is an unnecessary adjunct.

The coatings used are of two classes—(a) those which form a liquid slag which finally solidifies on the surface of the weld and is machined off and (b) those which volatilize at the temperature of welding.

With the flux which volatilizes easily, the effect of its presence will be chiefly an oxidizing of the carbon which would otherwise be carried into the weld. This will disappear as carbon dioxide gas. The liquid slag formed from the other kind of coating tends to retain heat causing the welded part to cool more slowly thereby reducing strain. A coating of either kind permits the use of special alloys in the electrode and so leads to the manufacture of electrodes according to a definite formula for special work. There is, however, a liability of the slag itself contaminating the weld. If ordinary care be taken and the work kept clean, a good weld can be made without flux, as demonstrated by American welders.

Considering now the joints used in the welding of boiler plate, we find that several different kinds are necessary. In the simple butt joint, Fig. 3, the deposited metal is actually in tension while it is in shear in the commonly used lap, Fig. 4, and strap joints, Fig. 5.

The butt joint shows strength of 90%-95% of that of the unperforated plate, and the welded overlap joint 70% to 80%, while a triple riveted overlap joint showed only 65% to 70% of the strength of the original plate. Riveted joints have a tendency to slip past each other, shearing the rivets. Further, in riveting, good metal is removed to make way for softer metal, while in welding the good material is not removed and a continuous joint of harder and stronger material is built up. The welded joint, though stronger than a riveted joint while under continuous stresses, will only last about 60% as long as a riveted joint under alternating stresses. Hence for ship construction where stresses are liable to be large and frequently alternating, the welded joint must be carefully made and tested to be sure that it will not fail at a crucial moment.

Such joints as the "Tee" joint, Fig. 6, or the "Plug" joint, Fig. 7, combine in some measure the features of butt and lap joints, and are used where conditions require such a joint. The plug joint is very much the same as a spot weld on thick material. Fig. 8 illustrates a Tack weld.

The Progress of Railroad Electrification

Particularly Adaptable On Heavy Grades, in Tunnels and in Large City Terminals—
U.S. Steam Roads Now Using 25 Per Cent. of All Coal Mined

—By Mr. Paul M. Lincoln*

In speaking to you on the subject of railroad electrification, I may say that my remarks will apply only to conditions in the United States. What I have in mind is the situation in general. My remarks will, therefore, not apply to any local conditions, but rather to the situation as a whole.

Just a word as to the history of railroad development. Organized transportation is one of the indexes of our state of civilization. It is one of the things that differentiates civilized man from the savage. And the railroad is the greatest factor in organized transportation, though it is less than 100 years old—the first commercial railroad having been started in Great Britain in 1825. If you consider the proportions to which it has grown you will appreciate the rapidity of the development in the art of railroading. It has indeed become the most important organization in our modern complex life. It is almost unnecessary to point out its bearing upon the unification of our institutions. If it were not for the railroad a condition might develop on this continent similar to that which obtains in Europe, where a journey of a few miles may bring you amongst a different race of people, speaking a different language. Those very conditions, I believe, were largely responsible for the recent troubles in Europe. It is the ease of transportation on this continent which will prevent a similar situation from arising here.

A few railroad statistics may be of interest. In the United States there are, approximately, 1,800,000 railroad employees. It is worthy of note that they comprise about 7 or 8 per cent. of the total number of wage earners in the United States. In 1917 the compensation of these railroad employees amounted to about \$1,000 per person for the year, or a total bill of \$1,800,000,000. That was before the higher scale of compensation was put into effect. There are 260,000 miles of railroad and the capital investment represented is, approximately, \$17,000,000,000, or \$65,000 per mile. The railroads of the United States use about 150,000,000 tons of coal per year, and the total coal mined amounts to 600,000,000 tons—so that the railroads use approximately 25 per cent. It is also interesting to note that they use about 10 per cent. of their efforts in hauling coal to haul the rest of the freight. In other words, if the haulage of locomotive coal could be eliminated, the capacity of the railroads would be increased about 10 per cent. Herein lies one of the arguments for electrification. Another striking fact to note is that, as shown by statistics, it takes about 6 lbs. of coal in a steam locomotive to produce 1 horse power of energy, while the same amount of coal, if used in a modern central station, would produce two, or, under the best conditions, three, and even four, times that amount of energy. In other words, the steam locomotive efficiency is only one-half to one-third that of the central station. Instead, therefore, of using 150,000,000 tons of coal per year to operate our railroads, the same service could be rendered by the central station, through electrification, with a reduction of 75,000,000 tons of coal, or perhaps, even a reduction of 100,000,000 tons.

Let me quote, in this connection, from a recent statement of Mr. E. W. Rice, Jr., when president of the American Institute of Electrical Engineers. Mr. Rice said:

*Before the Electric Club of Toronto.

"While the amount of coal in our country is enormous, it is definitely limited. While Providence has blessed us with a princely amount of potential riches in our coal beds, it is known that there is a finite limit to the amount of coal so stored and when this coal is once exhausted, it is gone forever. It is really terrifying to realize that 25 per cent. of the total amount of coal which we are digging from the earth each year is burned to operate our railroads under such inefficient conditions that an average of at least six pounds of coal is required per horse power-hour of work performed.

"The same amount of coal burned in a modern central power station would produce an equivalent of three times that amount of power in the motors of an electric locomotive, even including all the losses of generation and transmission from the source of power to the locomotive. Where water power may be utilized, as in our mountainous districts in the West, all of the coal used for steam locomotives can be saved. In the Middle and Eastern states, however, water powers are not sufficient, and it will be necessary in a universal scheme of electrification that the locomotives be operated from steam turbine stations, but as I have already stated, the operation of the electrified railroads from steam turbine stations will result in the saving of two-thirds of the coal now employed for equivalent tonnage movement by steam locomotives.

"We would not be justified in being so confident of the benefits of electrification of railroads if every element in the problem had not been solved in a thoroughly practical manner. The electric generating power stations, operated either by water or by steam turbines, have reached the highest degree of perfection, efficiency and reliability, while the transmission of electricity over long distances, with reliability, has become a commonplace. Electric locomotives capable of hauling the heaviest trains at the highest speeds, up and down the heaviest grades, have been built and found in practical operation to meet every requirement of an exacting service. There is, therefore, no element of uncertainty, nothing experimental or problematical, which should cause us to hesitate in pressing our claims upon the attention of the country. Electrification of railroads has progressed with relative slowness during these many years, waiting upon the development and perfection of all of the processes of generation and transmission and of the perfection of the electric locomotive itself. When all these elements had been perfected, as they now have been for several years, the railroads found themselves without the necessary capital to make the investment."

Electric locomotives are capable of hauling the heaviest trains up the steepest grades at the highest rates of speed. There is, therefore, no uncertainty as to the engineering success of electrification. But, while the engineering problems have been solved, we find the railroads without sufficient capital to make the investment required.

The steam locomotives on our railroads are necessarily non-condensing machines. The impossibility of using condensers results in a waste of 30 to 50 per cent. of the available energy in the fuel. Owing to the weight and cost of condensers they can only be employed in the central station.

* The electrification of our railroads has already been started, and considerable progress has been made. We know now that we must do more than solve the engineering problems; electrification must not only be an engineering success—it must be an economic success. In other words, the dollars spent on railroad electrification must show a return that will justify the investment. This can not be shown for all conditions, but it can be for certain specific cases, and it is these cases that form the entering wedge

which will ultimately result in the application of electrification to our national system.

There are three places on the railroads where electrification is particularly desirable. In the first place, it is of particular advantage in heavy grade sections, on account of its ability to haul heavier trains at higher speeds. The heavy grades are, so to speak, the neck of the bottle, limiting the capacity of the sections on which they are located, and since electrification can materially increase their capacity, there grade sections lend themselves to profitable electrification. One outstanding instance of this is on the Norfolk and Western line in West Virginia on the Elkhorn Hill, where there is a grade of about 2 per cent. for some 30 miles. This section was electrified several years ago and its capacity was increased to about double what it had been with steam. They are now hauling electric trains weighing about 5,000 tons at 14 miles an hour. This line, as you know, is a coal road, hauling coal from West Virginia to the port of Norfolk. In that particular case, the grade dictated the electrification, and it is a thorough success, both from an engineering and a commercial standpoint.

One other well-known road on which the grade was the reason for electrification was the Chicago, Milwaukee and St. Paul Ry. This road electrified that section of its line which crosses the mountains of Montana, there being three mountain ranges to cross in a run of about 440 miles. The electrification was carried out about four years ago, the first section having been installed by the General Electric Co., and it has proved a decided success. Power is purchased from the Montana Power Co. This same road also has authorized the electrification of another very heavy grade division in the State of Washington over the Cascade Mountains. The work has been delayed owing to the war, but it is expected that this section will also be in operation within the next four months.

Another place on the steam railroad where electrification is called for is in the tunnels. This is because the steam locomotive becomes dangerous in a tunnel, particularly where there is a heavy grade. There are cases on record where the crews of the locomotives have been suffocated, owing to the accumulation of gases when the engine stalled. One notable instance of this was in the Sarnia Tunnel under the St. Clair River. This tunnel has been electrified, as has also another tunnel at Detroit, for the same reason. The same is true of the tunnel of the Great Northern Ry. in Washington, which is five or six miles long. The tunnels have thus been isolated from the rest of the line and electrified, owing to the menace to life created by the use of steam locomotives in them.

The third place where electrification has been demanded is in the large city terminal. This was first forced upon the attention of the public in New York City. Many will remember how, some 16 or 18 years ago, a serious accident took place in N. Y. as a result of the signals being obscured by the steam and gases from the preceding locomotive. Many people were killed and public opinion was aroused to such a degree that the Legislature of New York State passed a law requiring that all railroads entering New York City should be electrified by a certain date. The date so fixed was, as I recall it, Jan. 1, 1907. In that way the question of electrification was brought to the front at a time when the art was not developed sufficiently to cope with such a large problem. The New York Central attacked it and adopted the same method as was used on our street railways, using 500 or 600 volts direct current, and the results have been very successful.

It is recognized, however that this method of electrification, while highly successful as a terminal electrification, cannot be applied to the entire length of trunk lines, and

does not provide a solution to the problem of electrifying the railroads as a whole. Some years ago when the Pennsylvania Railroad established a terminal in New York City, they applied the same method as the New York Central, using the 650-volt direct current system, but I think it was announced by the Board of Directors at that time that this was not intended as a precedent for the electrification of their trunk lines, but was merely a terminal undertaking.

Another road coming into the Grand Central Terminal at New York was the New York, New Haven and Hartford. This road's engineers gave the matter of electrification due consideration and adopted a different solution. They took the position that whatever system was adopted should be capable of extension to the entire road, and they decided on the alternating-current, single-phase method. This was the first application of this method and they had many difficulties to overcome. However, they passed through the pioneer period and their efforts have met with success. They first electrified the road as far as Stamford—about 35 miles—and later to New Haven—about 75 miles from New York. It is the intention also to extend the electrification to Boston and, ultimately, to apply it to the whole system.

This brings me to the question of the proper method or system of electrification. I don't think it is a matter that should be unduly emphasized. There has been too much energy spent by railway engineers in damning some other man's method. The main thing is to bring home the necessity of electrification by any method. Still, it is necessary to give consideration to the different systems. The New York, New Haven and Hartford used a 11,000 volt trolley, and an alternating current motor, which, however, was capable of using either alternating or direct current. The necessity of operating in both ways caused considerable complication, but the troubles thus entailed were overcome and the method is proving very successful and would have been extended much further had it not been for certain financial difficulties into which the road has fallen. This electrification stands to-day as typical of the alternating current method.

The greatest example of the direct-current method is the Chicago, Milwaukee & St. Paul electrification. In this case the engineers considered the best method was an extension of the recognized standard system used by the street railways. That is, they have obtained direct current from an alternating current supply, but the voltage adopted was much higher than used by the usual street railway.

Let us look, for a moment, at the development of street railway electrification. It was first started in Richmond, Va., by Mr. Frank Sprague in 1887, who did the pioneer work and made good. As a result street railway electrification grew with great rapidity and within ten years trolley lines were radiating all over the country. As the trolleys expanded and the cars grew heavier, it was found that 500 volts, as originally adopted, was not sufficient and the voltage was raised to 600 and then to 750. Then some engineer suggested doubling the distributing voltage, that is, going to 1,200 volts, and that worked alright. Later, on the advice of the engineers of the General Electric Company, the voltage was doubled again, and 2,400 volts was adopted on the Butte, Anaconda and Pacific, and, after successful operation, a still further increase was suggested, with the result that the Chicago, Milwaukee and St. Paul adopted 3,000 volts direct current, which has proved very successful. The work of the engineers of the General Electric Co. on the latter electrification, has been extremely creditable, and their troubles were remarkably few. The current is distributed from the sub-stations at 3,000 volts and is obtained from a general a.c. supply system at 60 cycles.

One other system worthy of comment is that used in

the Great Northern tunnel in Washington. In that case they used a 3-phase, alternating current system, with two overhead trolleys. The motors on the locomotive were three-phase. Still a different system was employed by the Norfolk and Western. They operate with a single-phase line, but convert it to a three-phase current on the locomotives and use motors of the same constant speed characteristics. The Great Northern tunnel is the only instance in which a three-phase line is directly used on this continent. On the Italian railroads, however, which have been electrified to a large extent, they use polyphase motors exclusively on their locomotives, entailing two overhead trolleys. American engineers, in general, think the employment of two trolleys inadmissible. For my own part, I consider that the two overhead trolleys, differing in potential, introduce too many problems to make for the highest efficiency.

There are then these three methods of electrification, which are open to the engineers of the railroads when they come to look at the problem of electrifying their lines. All of them are good. It is going to be necessary for the engineers to choose between them, but I do not believe that in doing so they should lay stress upon the differences of the systems, but rather they should make the general advantages of electrification understood no matter by what method it is carried out. The fact that stands out is that the railroads are now using 25 per cent. of the coal mined and that amount might be reduced from one-half to two-thirds by the general adoption of electrification, and further, that when operating by electricity, our water powers may be used. Once we burn our coal it is gone forever, but our water powers are gone forever only so long as they are not used. It is an economic crime to let our water power run to waste, and I believe the time will come when posterity will not bless us for having been so lavish with the resources at our disposal.

"Power Factor" Correction on Hydro Lines

For the purpose of power factor improvement, the Hydro Electric Power Commission of Ontario have recently installed at their Toronto Terminal Station, two 4,000 kv.a. synchronous condensers each equipped with its own exciter driven by a belt from the shaft of the condenser. Special tests were made to determine the effectiveness of these machines from which tests the following figures were obtained:—

	Condensers both off	One Con- denser running	Both Con- densers running
Input to consumers, kw.	0	310.0	619.5
Input to condensers, kv.a	0	3450.0	7052.0
Total excitation in kilowatts	0	39.41	76.15
Power-factor Toronto station load (lag)	76.4%	81.0 %	86.0 %
Power-factor of total Hydro load, measured at Niagara	84.9%	85.4 %	88.6 %
Power-factor of condenser bus		9.0 %	8.78%
Wattless factor, Toronto station load	64.5%	58.5 %	51.0 %

It will be noted that the power-factor of the Toronto Station load is raised, by the use of these condensers, from 76.4 per cent. to 86.0 per cent. The effect is more noticeable if the wattless factors be considered, for then one finds that this factor suffers a 21 per cent. reduction. For a given kilowatt load on the Toronto Station such an improvement in power-factor reduced considerably the line losses between Dundas and Toronto, and to a lesser degree the losses on the lines from Niagara Falls transformer station to Dundas.

These condensers are connected to the 13,200 volt bus in Toronto station and, as a result, any improvement in the

Condensers in Terminal Station

power-factor of this bus, means a reduction in the kv.a load carried by the step-down transformers between the 110,000 volt line and the bus. In other words the total kilowatt capacity of the station is increased,—about 12 per cent.

In addition to increasing the capacity of the station, the condensers very much improve the voltage regulation at the Toronto end of the transmission line.

Electrical Engineers, Limited

Electrical Engineers, Limited, is a new company formed in Calgary for the purpose of carrying on business as manufacturers' agents and general consulting engineers. They have already made desirable arrangements in a number of lines, but have not definitely closed for meters, transformers, centrifugal pumps, fans and blowers. The territory to be covered regularly is the province of Alberta and the Crow's Nest district in British Columbia, with, possibly, adjacent territory in Saskatchewan. The firm has already established itself in the consulting engineering business, and has a shop to take care of repair work; the engineer in charge of the service department had four years' experience in the Canadian Westinghouse factory and eight years with the city of Calgary as repair man and meter expert. The general manager of the new company is Lieut. Guy Morton, who returned from France only a few weeks ago. Lieut. Morton is a graduate of the University of Toronto, (1909) in the Faculty of Applied Science and Engineering, and, before the war, was branch manager, at Calgary, of the Canadian Westinghouse Company, and otherwise prominent in the business and social life of that city. The company's offices are at 202 I.O.O.F. Building, Calgary.*

The overseas members of the staff of the Shawinigan Water & Power Company celebrated Armistice Day, Nov. 11, by a dinner at the Engineers' Club, Montreal. Sergt.-Major Wood presided. The toasts were: "The King," "Our Fallen Comrades," "The Navy, Army and Air Force," and "the officials and ladies of the Company who remembered the boys in France."

Your window is the magnet of your trade.
It stands a good chance of drawing a \$35 prize
as well.

CANADA'S COAL

There is much concern in Canada, particularly in Ontario, which province depends largely upon imported coal, over the source of coal supply for the present winter, because of the strike situation in the United States.

Just why this worry should make itself manifest seems somewhat of a mystery, when one stops for a moment to consider and investigate the situation. In Alberta we have 16 per cent. of the total supply of coal in the whole world. The heating value of Western coal has been tested by householders, manufacturers, railways, and power plants throughout Western Canada, and all concerned have found Western coal an economical and efficient fuel. Steam coal produced in the Crow's Nest Pass district compares very favorably with the very best United States steam coal, and big concerns like the Canadian Pacific Railway, the T. Eaton Company and the Winnipeg Electric Railway Company have adopted the use of this coal because of its qualities as an efficient fuel, linked up with a big saving in the annual coal bill. In Alberta we have over 300 mines, many of which are equipped with the most modern equipment, costing millions of dollars, and yet the annual production of these mines is only 40 per cent. of what could actually be produced. This is because of a lack of a market that can take all the coal mined. At present Western Canada imports about 3,000,000 tons of coal annually, valued at \$18,000,000. This huge sum of money is sent to the United States to pay for coal imported into this country. That money assists to develop United States industry. It helps to keep the overhead expenses of the mines low because of the fact that the more coal produced means less overhead expense. Again, by sending this \$18,000,000 out of Canada we are very materially affecting our already heavy adverse trade balance. The fact should not be lost sight of, too, that on this \$18,000,000 we must pay \$720,000 in exchange alone.

The whole trouble why Western coal operators have not made more headway in marketing their product is owing to a lack of educational propaganda—as it were, to a lack of pep. They have the product, the men, the equipment, and the market. But the operators must be assisted in their problems by everybody concerned in the welfare of the future of Canada. Daily and trade papers, boards of trade, wholesale and retail coal dealers, all must spread the propaganda that we have in Western Canada coal that has been tested and found to be equal to that which has been imported for so long. Emphasis should be laid on the following facts: one of Canada's principal industries will be materially assisted to develop; millions of money will be kept in the country and so help our adverse trade balance; equally as good heating values can be obtained from Western coal as

from imported coal; the more Western coal used, the lower the overhead at the mines, and consequently lower to the consumer.

Alberta operators complain, and justly too, that their overhead expenses are very high through their inability to secure a market for slack coal, which is now merely thrown away. For instance, smaller mines in the Lethbridge field waste 50,000 tons of this product annually. Slack coal can be utilized to advantage in power plants. Such plants at Regina, Saskatoon and Winnipeg have burned this fuel with great success.

Another factor that is keeping back the development of the coal mining industry of the West is the high freight rate applied to all grades of coal, especially on slack coal.

The "Western Canada Coal Review" in a recent editorial criticized very severely the actions of the Dominion Government and the Provincial Government of Manitoba in asking for bids for coal specifying that only United States coal was required. Why this discrimination? Why this encouragement to buy in foreign markets when an equal product is at our own doorstep? Why this apathy to our severe adverse trade balance? Why this discouragement of the development of our natural resources? Why this apathy towards assisting the employment problem in Canada? Perhaps the Government officials can answer.

As an instance of ignorance of even many Winnipeg manufacturers of the burning qualities of Western coal, a certain representative of a large coal mine visited Winnipeg in the Fall of 1918, and found a manufacturer was contemplating placing a big order for the best American steam coal to heat his power plant, not giving any consideration whatever to Canadian coal. After talking over the possibilities of burning Alberta coal in his plant, he decided to give it a trial. This year, the same manufacturer without any hesitation whatever, promptly gave this same mine another big order for his coal supply for the winter of 1919, saying only one word in reply to the mine's representative of what he thought of the coal: "WONDERFUL."

At present Ontario is faced with what looks like a fuel famine. Why should this be? At the moment of writing there are stored at the head of the lakes 250,000 tons of soft coal and 324,000 tons of anthracite, with additional shipments arriving as lake steamers arrive. Now, why should there be a shortage in Ontario when this supply is lying at the lakes ready for shipment into Western Canada? Does not this importation seem like "Carrying Coals to Newcastle"? Why should the Ontario Fuel Commissioner not commandeer all of this coal and divert it to Ontario and so help the serious fuel situation in this province?

Are we to sit still and smile, or act? Which is it to be?

The Contractor-Dealer

What Is the Fair Overhead to Charge?— Should It Be the Same for All Jobs or Vary With the Size—The Chicago Estimators' Association Supply an Answer

From time to time we have spoken of the work of the Chicago Estimators' Association, which was formed a couple of years ago to make a study of the various overhead percentages, which were properly applicable to electrical contracting jobs of varying value. The work of the association to date was explained before the recent contractors' convention in Milwaukee, by Mr. Morley, a member of the Estimators' Association. Mr. Morley first outlined briefly how the data upon which they based their conclusions were obtained.

The committee decided that a curve of "overhead" should be developed. At first it was intended to base this curve on the ratio of the cost of carrying on business to the yearly volume of sales, but it was soon discovered that such a curve could not be plotted as work of different cost values carried entirely different overhead costs, and a curve showing the percentage to be added for different construction costs was then decided upon.

In order to obtain data with which to work, questionnaires were sent to contractors requesting information as to yearly volume of business and the items of cost of carrying on the business which cannot, on account of their nature, be apportioned directly to the jobs—rent, heat, office salaries, stationery, telephone and many other items of like nature.

About a dozen replies were received and with this information the committee proceeded in the following manner:

A 10 per cent. profit over selling cost was assumed for each yearly volume of business. Deducting this profit gave the selling cost. Each questionnaire gave the overhead cost. Deducting this cost from the selling cost gave the construction cost.

This construction cost for each questionnaire was divided into hypothetical contracts of various numbers and costs from \$25.00 to \$10,000, depending on the yearly volume of business. The division was made by each member of the committee and the results obtained averaged.

Percentages of overhead were then assigned the different sized contracts according to their size, in a manner that the total overhead for all the contracts for each questionnaire equalled the amount reported for same.

A great amount of work was required to find percentages which would apply to the same cost amounts for all questionnaires and bring the total overhead cost the same as given in each questionnaire. When these percentages were found a curve was plotted.

Starting at \$200.00 with 52%, the curve falls rapidly to 42% at \$500.00, 36% at \$1,000, 29% at \$2,000, and then more gradually to 25% at \$3,000, 22.5% at \$4,000, 21% at \$5,000 and still more gradually to 18.7% at \$7,000, 16.2% at \$10,000 and 14.5% at \$15,000. Proceeding to higher values, we find a still more gradual decline to 13.2% at \$20,000, 10.2% at

\$40,000, 9% at \$100,000 and 8.5% at \$160,000, beyond which the curve is practically a horizontal line.

In using these percentages it must be borne in mind that they apply to the estimated construction cost, which must include the items as given in the table of overhead percentage.

Construction Cost

The items entering into the construction cost are: Material taken from plans and specifications, labor, installing and handling material, supervising of foreman, time clerk and stock clerk where the size of contract requires same, travel time and expense, meaning carfare and time lost where work is out of town and not far enough to board the men, board when necessary, freight and cartage, plans and drawings, delays caused by other contractors, cutting and patching, painting conduit if required, inspection and license fees, bond if required, insurance, fire and accident, pro rata charges if any, watchman, telephone service and storage if

TABLE OF OVERHEAD COSTS

Estimate Sheet Cost	Over-head %	Estimate Sheet Cost	Over-head %
\$ 200	52.0	\$ 2,900	25.4
250	48.5	3,000	25.0
300	46.6	3,500	23.6
350	45.3	4,000	22.5
400	44.0	4,500	21.7
450	43.0	5,000	21.0
500	42.0	5,500	20.3
550	41.2	6,000	19.7
600	40.5	6,500	19.2
650	39.8	7,000	18.7
700	39.2	7,500	18.2
750	38.5	8,000	17.8
800	37.9	8,500	17.4
850	37.4	9,000	17.0
900	36.9	9,500	16.6
950	36.4	10,000	16.2
1,000	36.0	11,000	15.5
1,100	35.0	12,000	15.0
1,200	34.2	13,000	14.7
1,300	33.4	14,000	14.5
1,400	32.7	15,000	14.3
1,500	32.0	20,000	13.2
1,600	31.3	25,000	12.2
1,700	30.7	30,000	11.5
1,800	30.1	35,000	11.0
1,900	29.5	40,000	10.8
2,000	29.0	45,000	10.6
2,100	28.5	50,000	10.4
2,200	28.0	60,000	10.0
2,300	27.6	70,000	9.6
2,400	27.2	80,000	9.3
2,500	26.8	90,000	9.1
2,600	26.4	100,000	9.0
2,700	26.0	130,000	8.7
2,800	25.7	160,000	8.5

Here's a Christmas Present for You

YOUR WINDOW DISPLAY IS YOUR BEST SALESMAN

Between now and Christmas the Electrical-Dealers of Canada will be putting forth their best efforts to attract the holiday trade and some fine window displays will be shown.

The biggest problem before the electrical industry to-day is not engineering or manufacturing—the real problem is “merchandising.”

We believe that well dressed windows—goods properly and tastefully displayed and demonstrated—are the most effective means of increasing the sale of electrical appliances.

With a view to encouraging the art of window dressing among electrical contractor-dealers, and, also, having in mind the value of the interchange of good merchandising ideas, the Electrical News offers four prizes for best dressed windows, under the following conditions:

- | | | |
|-----|--|---------|
| (1) | First prize | \$35.00 |
| | Second prize | 20.00 |
| | Third prize | 10.00 |
| | Fourth prize | 5.00 |
| (2) | The contest is open to any electrical contractor-dealer, municipality or central station in Canada. | |
| (3) | Photographs of window displays must be in our hands by December 31, 1919. | |
| (4) | Explanatory notes up to 100 words may be submitted with each photograph. | |
| (5) | The merits of the photographs will be judged by an impartial committee of three—one manufacturer, one jobber, one contractor-dealer. | |

Plan now to enter the competition. You have an even chance to win a prize. In addition to that, however, it is a dead certainty that your effort to produce a better window display will be reflected in your more abundant Christmas trade.

Address photographs and all communications:

“Best Window” Contest,

Electrical News,

347 Adelaide St. W., Toronto.

required. These are all items which must be allowed for in construction cost and not left for overhead.

Mr. Morley gave the preceding table as a result of his association's investigations, covering estimate sheet cost varying from \$200 up to \$160,000, the overhead percentages varying the other way, from 52 per cent. down to 8.5 per cent. These figures are shown in diagram also herewith.

Attention was also drawn to the fact that the Estimators' Association has been working on a standard specification to be used for such work as will not warrant the services of an engineer. It was stated that they expected to have this specification ready within a year.

Another item brought up was that of improving the present system of symbols. It was pointed out that the symbols in use to-day were adopted some 15 or 20 years ago and that some of them, such as the base, floor, push and telephone outlets, should never have been introduced, as their resemblance to the building lines makes them difficult to locate. The speaker explained the symbols which his association had decided to use, and, in submitting them to the contractors, made the request that they appoint a committee to work with architects and consulting engineers with the object of adopting standard symbols universally.

"Sault" Contractors Organizing

The contractor-dealers of Sault Ste. Marie, Ont., recently held a meeting to discuss the question of organization. Mr. McIntyre, president of the Ontario Association, has since outlined to them the plan of organization which enables them to come in on the district basis, and it is hoped that they will see fit in the near future to take this important step.

Do you believe you can dress an attractive, business-pulling window. Show your confidence in your own ability by entering the "Best Window" contest.

Electrical Jobbers' Activities

A well attended and enthusiastic meeting of the Canadian Electrical Supply Jobbers' Association was held at the Royal Connaught Hotel, Hamilton, on Monday, November 17th, 1919, Mr. M. K. Pike in the chair. This association was organized last spring for the purpose of promoting good will and co-operation among its members and between the jobbers as a whole and the various other branches of the Electrical Industry. The different divisions of the association have been holding frequent local meetings but this was the first general meeting of the association since its organization. The meeting was exceptionally well attended, only four or five members being absent, which is considered a remarkably good showing when it is realized that this organization covers the whole of Canada, having members as far east as Halifax and as far west as Vancouver.

The morning session was devoted to association business and adjourned at 12.30 for lunch, on which occasion the members were the guests of Mr. Moncur of the James Moncur Electrical Co., the only member having headquarters at Hamilton. The meeting was again called to order at 2 p.m. to hear an address by Mr. Kenneth A. McIntyre, Chairman of the Ontario Association of Electrical Contractors & Dealers, who had been invited to speak to the members on the subject of "Co-operation between the Jobbers and Contractor-Dealers." Mr. McIntyre briefly outlined the Goodwin organization scheme, pointing out that there were the four links in the chain—(1) the district; (2) the province; (3) the Canadian division; (4) the National Association. As to the situation to-day, he pointed out that British Columbia was organized and affiliated, and that the Ontario organization was already provided, though Toronto was the only district yet formed. They were, however, negotiating with Hamilton, Brantford and Kitchener, and would tackle other districts later.

How the Jobbers' Association Can Help

Mr. McIntyre enumerated the ways in which the jobbers could help:

(a) By realizing that the final success can only come

with the complete organization of the entire industry.

(b) By becoming associate members of the contractor-dealers' organization.

(c) By attending, and having their salesmen attend, their meetings, thus making them better salesmen because of their increased knowledge of their customers' problems.

(d) By listing their contractor-dealers customers and checking them to ascertain the names of those not belonging to the contractor-dealers' association.

(e) By making a direct effort to get these customers to join, pointing out to them that it is their duty and also greatly to their advantage.

(f) By informing the contractor-dealers' association as to the names of such non-members, so that they could supplement their efforts.

(g) By arranging for a joint secretary.

The chairman then spoke briefly, thanking Mr. McIntyre for the address, complimenting him on the interesting points brought out, and expressing the desire of the members of the Jobbers' Association to co-operate in every way possible with the contractors and dealers for the betterment of the industry as a whole.

When the afternoon session was over the members left Hamilton in a body to attend the meeting of the Electrical Supply Jobbers' Association of the United States, which was holding a three days' general meeting at Cleveland, Ohio. The Cleveland meeting was a great success and of considerable interest to the members of the Canadian Association, as the objects of these two associations are similar and the problems met with in the United States are much the same as those in Canada.

Mr. Wakeman Visits Canada

A large and representative gathering of electrical men of Toronto met on Monday evening, Nov. 24, to hear an address by Mr. J. M. Wakeman, general manager of the Society for Electrical Development, who was visiting Toronto for two or three days on certain business matters connected with his society. Mr. Wakeman delighted his hearers as he unfolded the plans of his organization for the popularization of the use of electrical appliances throughout the homes of Canada and the United States, and, at the same time, convinced them that very splendid results had been accomplished in the period of six short years. Mr. Wakeman spoke of the assistance rendered by the society to its members, the advertising copy supplied, the information available on practically every phase of electrical merchandising and the general publicity work in popular magazines and newspapers. One of the most valuable ideas that has been taken up by the society is the production of a movie play, placed in a setting not unlike that of the good old story of Rip Van Winkle. The centre figure in this play was a criminal who had been sentenced to 25 years' imprisonment and was only released in the year of grace, 1919. The picture shows him being introduced to the various electrical developments, one by one, that have taken place during the last 25 years. It finally ends up with a meeting of old friends, dining amidst all the conveniences and luxuries of modern electric table appliances. Mr. Wakeman also spoke of the work that had been done to combat the idea so often suggested by newspapers, municipal authorities and others, that fires (which cannot be readily attributed to any cause) must have had their source in faulty electric wiring or electrical devices. This and other instances convinced his hearers that the work of the society was invaluable and must be carried into Canada with more vigor than has been possible in the past.

At the conclusion of the meeting application forms were

passed around and indications are that the society will have a number of new members from the Toronto district.

The Ontario Association Gains Strength

Word has been received from Mr. C. D. Henderson, of the Telephone City Electric Club, Brantford, who, with Messrs. McLean and Perry, the president and secretary of the club, were a committee of three to consider the advisability of forming a district branch of the Ontario Association of Electrical Contractors and Dealers, that a unanimous decision was reached on the evening of November 17th to establish a district branch with Brantford as the centre. The Telephone City Electric Club is to be congratulated on the step taken, as it is the first district to join up under the recently determined plan of provincial organization. The scheme, roughly, is that the province shall be divided into districts or sections, each represented in a parent association—the Ontario Association of Electrical Contractors & Dealers. In this way local matters occupy the attention of local organizations only, and it is only when matters of general interest are under discussion that the provincial executive or the association as a whole will be asked to pass judgment.

At least two other districts, already formed, are considering the question of amalgamation with the Ontario Association, under this scheme of organization, and other districts are in prospect of formation. The biggest difficulties appear to have been overcome, namely, arousing the interest of the individual contractors and dealers, and convincing them that the present scheme of organization offers greater advantages than any other that has been suggested. The Ontario Association is now on the high road to success and, as it gathers strength by the addition of districts here and there throughout the province, is bound to become a powerful agent for improving conditions in the whole electrical field.

Training Their Foremen

The Crocker-Wheeler Company of Ampere, New Jersey, has just inaugurated a plan of training for their foremen and other factory supervisors which is of considerable interest. A group of 62 men has been formed to pursue a three months' course in Modern Production Methods, which comprises the study of specially-prepared text units, the solution of problems relating to the units, and the discussion of this material at six bi-weekly meetings held after hours in the plant. These meetings will provide an opportunity to bring home the application of the work to the special problems of Crocker-Wheeler production. At each meeting a lecture will be delivered by an experienced production man and the lectures will be followed by a round-table discussion. Included in the group, besides foremen, are the superintendent and three assistant superintendents, which insures that the meetings will be highly resultful to the members of the class. The subjects to be studied are:

How to promote team work in the shop.

Handling men in a way to increase production and promote harmony.

How production should be organized.

Efficient purchasing, scheduling, routing, repairing, etc.

Keeping down the overhead by stricter cost keeping.

Major problems of management.

Have you laid your plans to enter the "Best Window" competition?

What is he writing?

"There is no joy like Giving"

We do not pose as being able to improve on Santa Claus' ideas of a Jolly Christmas, but we do feel that—living away up in the far North as he does, where the water-powers are all frozen up solid and the fuel is buried under miles of ice—Santa Claus hasn't had much of a chance to learn of the luxuries of electric heat and light. If he had, we feel sure he would have written:

" There is no joy like giving electric presents."

And for that matter we might go further and suggest that there are few joys equal to that of receiving electric presents.

They add so much to the luxury and comfort of life.
They relieve to such a degree the drudgeries of life.
They are so safe, so sanitary, so constantly in demand
in every operation in every house.

We have 262 different electric articles in stock—a wide range of prices—suitable for every member of any family.

Big Cry for More Electric Stores To Take Care of the Demand That Has Been Created

The big cry is for more electric merchants. The answer is always the same—we haven't the money to get started.

Doesn't such a reply ignore the fact that banks exist largely for the purpose of "selling" accommodations? If they don't sell their stock in trade, how can they exist any more than a grocer could live if he kept all his wares on his shelves. The banker is anxious to lend. All he requires is security, and this security is not necessarily bonds or mortgages—it may just as readily be a record for honesty and fair dealing, a good reputation in the community, or a clear cut statement of your business, showing a fair profit.

If you have a proposition that looks to you to be straightforward and reasonable, don't hesitate to go to your banker and lay the whole matter before him. Here are some helpful suggestions by Mr. E. L. Seabrook, in the Electrical Contractor-Dealer. He heads his article, "Hiring Money—How to do it," and shows it is not generally as hard as it looks:

Mr. Sanders had just completed what were to him several good sized electrical contracts which had not been paid for, and several other fair sized pieces of work were about ready for him. He needed money if he was to continue discounting his bills. He saw but one way out of it, and that was borrowing the necessary funds. After considering the matter very carefully he went to the bank in which he kept his account.

"I want to borrow \$800," he said to the cashier.

"What do you want this money for?" the cashier asked.

"I have just finished quite a lot of work. The payments are not yet due, it might be considered a sign of financial weakness if I should ask for payments immediately. I have recently made it a practice to discount my bills and I can save money by doing so within the next few days. I have some other work that is just about ready for me to start and I want to buy my material at the very best figure possible. It looks like good business if I can borrow at the rate of one-half of one per cent. a month and take the discount."

The cashier asked him if he could make a statement of his business affairs. He could and did so during the day. This statement showed how much he owed the supply houses, what was due him from others, and also the progress he was making in his business. He was definitely able to show his banker that the business was being conducted at a profit. He secured the loan.

The Banker's Business

This incident brings out several interesting points. The first is that it is the business of the banks to lend money. That is what they are in business for and are generally eager to lend money or "hire it out," if you please, for a definite period. This is not the only way some banks make money for themselves, but it is the great source of their revenue. If banks did not loan money, they would be compelled to go out of existence. Furthermore, it is the business of the banks to loan money for legitimate business projects. That is primarily the object of their organization.

J. Pierpont Morgan said at one time, which is quoted by thousands of bankers: "Credit depends on character more than on capital." The size of the bank balance, nor the

business, does not count so much after all as the man. The loan is made to the man and not his bank account or business. One may be wealthy, but if he is dishonest the banker does not care to risk the loan.

Perhaps some electrical contractors may have the idea that it is poor business to borrow money from the bank. This is a big mistake, provided that money can be saved or credit maintained by such borrowing. Why do not more electrical contractors avail themselves of this privilege? Why do they misunderstand the very purpose for which banks exist, and also fear the banker? Why do they pay the penalties for being short of funds, impairing their credit, when "hiring from the bank" is possible on terms profitable to them as business men?

Three Essentials of Contracts

Is it because they look upon finance as a secondary feature of their business? Is it because they are thinking in terms of contracts instead of dollars? They think of hiring labor to perform these contracts as a matter of course, but not of hiring money in the same way. Do they forget that there are three essential parts for every contract—labor, material, money. No one expects to pay spot cash for the material purchased, or do all the work with his own hands. Why not look upon money that must go into the contracts in some such way?

No doubt many readers will say to themselves that all of this sounds very simple, but that financing is not for them, they have no standing, so they think, at the bank. What security can they offer? Most men, if they are honest and

A well dressed window is a splendid salesman. It may also win you a \$35 prize.

industrious, have a standing at the local bank, whether they know it or not. The security desired may not consist of just what they think it does.

The story is told of a contractor that did some work for a well-known firm in one of the largest cities of the country; he did it so well that the firm wrote him the following letter:

"We have your letter enclosing certificates from the department of——— and wish to thank you for the same.

"We note what you have to say in regard to the work of installation, and wish to say that it has been a real pleasure to the writer to work with you on this job. We shall be glad at any time to say a good word for you whenever it will be of service."

Incidentally this contractor showed the letter to the cashier of his bank without any thought of the impression it would make on him. He was feeling good because of the satisfaction he had given and that this satisfaction had been expressed to him in written form. The cashier asked for the privilege of making a copy of this letter. Naturally the contractor expressed his surprise and asked the reason. The cashier replied:

"With a copy of that letter in our files your credit in this bank will be increased \$5,000."

This bank is one of the largest ones in the country, which shows that big banks are anxious to accommodate small borrowers.

In asking for a statement of the business the banker wants an evidence of character just as much as he does an evidence of wealth. He is looking for good business judgment, whether the business investment has been leaking away or earning a profit, that you are not a loser, but a gainer. The only way to make a balance sheet that will get

money from the bank is by good business methods, and in the main this means making money and not losing it.

Banker Has Something to Sell

For every electrical contractor who cannot borrow from the bank because of his credit standing, there are many who can but are afraid to try because they do not understand that the banker is a business man with something to sell, and is in business to hire out his funds the same as a supply house is in business to sell its merchandise. If a man has a good merchandising credit he can also secure credit at his bank, if he will go at it in the right way.

Two partners, in an Ohio village doing a nice little business ran short of cash. They had some bills they wanted to pay at maturity. Very timidly they went to the banker and told their story frankly.

"How much money do you want?" asked the banker.

"About \$1,400 would see us through if we could get it," said the bolder of the partners, while the other almost fell out of the chair, expecting the whole subject to be dismissed at once.

The banker said to them that their statement showed a fair business progress; he had naturally been watching them and their account. They worked hard, their customers spoke well of them; they owned their own homes and were not extravagant. He concluded by saying the bank would be very glad to loan the amount on their joint note.

Got Control of Business

In an Indiana town a partnership had to be dissolved and one of the partners was in a quandary as to how he could secure the necessary funds, even temporarily, to take over the entire business. As a last resort he thought about consulting his banker for advice and laid the proposition before him. The banker asked for a statement of the entire business and questioned the partner very closely, with the result that the bank advanced sufficient funds for this man to secure control of the business.

Leaving the Doors Unlocked

A salesman was talking to an old customer, upon whom he happened to drop in a few days before Christmas.

"Do you lock your doors when you leave your business in the evening?" the salesman queried.

"Why, of course. What a foolish question! Do you think I make so much money that I want to give it away?" replied the dealer.

"Well, I don't know," continued the salesman. "You may not be giving it away in just the sense you mean, but you are leaving things undone that amount to just the same thing. Now, just as I came along the street I noticed that your neighbor hardware merchant has a fine display of Christmas toys, electric trains, Christmas tree lighting outfits and so on—and he told me they were selling like hot cakes. Then over here your druggist neighbor is following the same lead. Yet you don't seem to care. There is no sign of these things in your window or even in your store. I thought, perhaps, you didn't care about money."

"Well now, I never thought about it just that way," replied the electrical dealer. "There seem to be such a lot of good ideas in the merchandising business that I get behind trying to keep up. But now you have gone so far as to criticize me I am going to keep you here until you give me some suggestions for my Christmas window."

"Oh, well now," said the salesman, "I don't hold myself up as knowing anything much about window dressing, but since you ask my advice I would say, first, that you need lots of color and light. Red and white and green are the Christmas colors that give the best effects. Then you want 'life' to your window—something moving, if

The Final Appeal

Do your Christmas shopping early, do it early, mother dear, buy those gift cigars for father ere the cabbage leaves are sere; get the fancy ties for brother, all hand painted, nice and sweet, while the holly's in the window and the Jimcracks fill the street. Buy the cook an inlaid poker, lift the milkman from the dumps, get him, mother dear, some ribbons—pale pink ribbons for his pumps. Let us then be up and doing, bright and early, mother dear; we must buy cut glass and china for our brothers' Christmas cheer; we must do our shopping early, buy the toys with pizened paint, so that dearest little Willie may curl up and be a saint. Hook me up, my dearest mother; put my state wide hat on straight; we must hasten, we must hurry, or we'll be—alas—too late; ere the celluloid cuff boxes and the plush-bound tomes of lore, and the four-cent Christmas greetings all are gone for evermore. So let's hustle, dearest mother, let us swiftly hit the pike; to our Christmas shopping early let us make a gentle hike.

WALT MASON.

possible—an aeroplane with a little model of old Santa Claus at the wheel, or an electric train with Santa Claus acting as engineer, or in some other capacity, or a fan blowing colored ribbons with Santa Claus heads on them. Work in a Santa Claus face or figure wherever you possibly can, so as to give the impression that all your goods are very much in favor with his Santanic Majesty. Then think of the electric toys and small appliances that you can display—all suitable for electrical gifts. Do you know that the Society for Electrical Development has a printed list of two hundred and sixty Christmas electrical suggestions? Get a copy of that list and bring those items to the fore in your displays."

"Well you certainly have given me some inspiration," said the dealer. "I'll start that window to-morrow and you come down this way to-morrow night and tell me what you think of it."

"I'll do that willingly, but I must be off now; good night."

"Good night, and much obliged to you."

The next evening, the salesman, according to his promise, walked home past Mr. Dealer's store. What a transformation! The dealer had caught the spirit and, on his own initiative, had secured a small spruce tree, which fitted nicely into one corner of his window. This he had decorated appropriately with electric bulbs of varied color—small figures of Santa Claus, etc., and had clustered around the base a half dozen of his smaller electrical devices.

More than that—the salesman had some difficulty getting a view of the window; several children were gathered around it, ushering in the Christmas season with oo's and ah's, and importuning their parents to buy, and the store was better filled than the salesman had ever seen it.

His dealer friend was too busy to be interrupted so he turned his steps homeward, pondering deeply the possibilities of the electrical merchandising business.

It's not the value of the prize altogether—though \$35 is useful enough these days. But think of the satisfaction of knowing your window is judged better than that other dealer's.

Christmas Window Suggestions

Make Your Store Front a Selling Magnet! Here Are Four Suggestions for Seasonable Window Trims that will Sell Your Goods to the Passerby

No. 1

In No. 1, the suggestion is built around "Hang up the Christmas Stocking." The Christmas poster design is placed in the middle of the background. At each side are "stockings" cut from colored cardboard. Artificial holly is festooned across the background and ends and hangs in pendants near the poster.

At the front of the window, against the glass, is a large cut-out Santa Claus head, made by your local card-writer. At the other side is the end of a fireplace. This is painted on heavy paper and fastened to the window glass.

The show-card says, "Ask Santa to put something Electrical in your stocking this year."

No. 2 has the head and shoulders of a large Santa Claus, with a panel card inscribed, "Give Something Electrical This Christmas," held in his hands.

Santa Claus is painted in color on heavy cardboard that is then cut out and fastened to the background. Red Christmas bells and festooning are hung from the panel and corners of the background. These can be bought from a stationery store. At the ends of the windows are Christmas Posters.

This is a seasonable idea, and tasty, yet easily and quickly prepared. It leaves unlimited scope to many different arrangements of the window floor.

No. 2

No. 3

Across the background and ends in No. 3 extends a frieze of Christmas trees. These are of green with red bases on a white background.

A fireplace is built against the background. This can be made by building a light frame-work and covering with crepe paper which comes in red with "bricks" lined across it.

The shelf can be made to look heavy by facing it with a strip of wood, 1½ inches wide. The chimney section above the mantel could be made of gray cardboard. Artificial holly and red ribbon are used for embellishment.

No. 4 has the Christmas Poster placed well up on the background with a border of artificial holly. Twelve panels representing the months of the year are the other features of the background. At each end is a wreath of artificial holly and from these extend festoons to the middle where a pendant is hung.

In the foreground, a show-card states, "A gift that is remembered all the year, 'something electrical'."

The panels and show-card can be obtained from a local show card writer and the holly from a stationery store.

No. 4

Publicity, to Attract the Customer, Must be a Little Bit Out of the Ordinary

Advertising that is just a little out of the ordinary will often attract the eye or the attention of a prospective customer and transform him into a buyer. It is not necessary to be a buffoon or a "smart" guy. Originality, backed by a fair supply of gray matter in the person preparing the advertisement is all that is needed. Some examples are noted in Western advertising:

"A cigar dealer in Harrisburg arranged an exhaust from the motor of his delivery automobile so that it reached the tip of a huge cigar mounted on the roof. As the wagon goes about the city, the smoking cigar not only attracts attention, but indelibly impresses the name of the dealer upon all who see it.

An ice company solved the problem of proving the value of their ice by freezing a clock inside of a large cake of ice. This was then placed on the sidewalk with a sign reading: "See how long it takes our ice to melt."

A bank in the Middle West tried the experiment of placing a full-blooded cow on exhibition in the lobby, and 276 new accounts—the majority from farmers—were opened in a single day.

A clothing company in Indianapolis, Ind., secured fifty homing pigeons, attached to each one a tag entitling the finder to a suit of clothes, and then gave publicity to the project by widespread newspaper advertising. The result was an increase in sales which more than offset the cost of the pigeons and the suits which were given away.

Capitalizing the idea that crowds are always interested in action, the Moe Levy Company of New York makes it a point to change its window displays during the noon hour when the greatest number of people are on the streets. The window trimmer "carelessly" knocks over a figure and this in itself is sufficient to attract the crowd. After the display has been put in place, the manager comes outside, peers through the glass, and directs that certain changes be made. The crowd often takes such an interest in the proceedings that it will volunteer instructions as to the arrangements of the display."

Twenty serious retail leaks through which profits escape are listed by a retail specialist as follows:

Over-measurement of goods; reckless cutting of samples; non-avoidance of remnants; slothful care of stock; careless packing; improvident purchase and use of supplies; discarding empty cartons; shopworn goods through lack of suitable fixtures; poor arrangement of stores; extravagant illumination; pilfering of goods and money by employees; losses through incompetent window trimming; employing incompetent help; dissatisfied customers; carrying dead stock; poor buying; excessive alteration extras; poor advertising; poor bookkeeping, and passing discounts.

Probably no electrical retail business is suffering from all the twenty leaks, but most establishments can find two or three. Why not stop them up?

Sending mazda lamps by mail and adding the charge to the next bill for current is a convenience recently initiated by the Duquesne Light Company, Pittsburgh. The postal authorities will not insure the lamps, on the ground that they are too fragile, but the use of a special corrugated box package reduces breakage to a minimum, and the company undertakes to replace any lamps found defective if they are tested on receipt. A telephone call or postal card to the electric shop of the company brings by return mail as many lamps as the customer may require.

More lamps are used by people who have a case of spare lamps handy than by those who are accustomed to buy only two or three at a time. For this reason one elec-

trical salesman has cultivated the habit of signing lamp contracts with small stores and factories for their yearly supply, instead of confining his attention solely to large lamp contracts.

A store which has an extra case of lamps on the premises will tend not to have empty sockets, whereas the custom of buying two or three lamps at a time induces postponement in the replacement of old or broken lamps.

The signing of lamp contracts with small stores brings in orders for cases of lamps and the owners of these do not make shift for an indefinite period with worn-out lamps and empty sockets. The result is an appreciable increase in lamp sales.

A convention idea which proved efficient and handy was the ticket book arranged by the American Society of Mechanical Engineers for its spring meeting. The book, which was about 4½ by 2½ inches, contained duplicate detachable tickets for every event of the convention. On the

Window trim suggestion by the Society for Electrical Development for its campaign "An Electrical Christmas"

cover was an announcement to the effect that it was necessary for the visitor to have the book of tickets with him each day, and to register for each event at the time of receiving the book. In this way those in charge were able to keep track of the number to be expected at every moment.

Mirrors in your show window are a very effective device, but they should be placed with great care, or they will do more harm than good. The unprincipled public has an incurable tendency to use them for putting its hat straight, or seeing whether its shoes are run down at the heel. If you have mirrors in your window, arrange them so that they reflect your stock and not the street. It is all very well to be accommodating, but window displays have a purpose. Do not defeat the purpose by tempting the public to regard them merely as inconvenient obstructions to a handy mirror.

Plans for building a canal running parallel to the Rhine River from Huningen to Strasbourg, a distance of about 80 miles, have been perfected by the French Government. The canal would be built and operated in such a manner as to permit the construction of ten hydro-electric stations with a total capacity of seven million horsepower.

Hon. Mr. Burton, minister of railways, South Africa, in the course of a talk at Johannesburg, announced a comprehensive scheme of railway electrification throughout the country.

Lincoln Meter Co. of Canada Manufacturing Meter for Peak Load Registration

It was nine years ago that Mr. Paul M. Lincoln, of Pittsburgh, conceived the idea that a demand wattmeter, based on the heat principle, was worthy of investigation. Experiments were commenced at that time and have been carried on ever since with a persistency characteristic of the scientific research student. As a result patents were issued in Canada in 1915 and 1916. A number of meters, in their complete form, were also built up in 1916, and have been under test in various parts of the continent. For a period of three years they have given consistent and satisfactory results. Incidentally, approximately \$52,000 has been spent during this experimental period, which gives some idea of the scope and thoroughness of the investigations necessary to produce a meter in its completed state. Finally, in October, 1918, the Lincoln Meter Company, Limited, was formed for the manufacture of the Lincoln Demand Meter, with head office and factory at 245 College Street, Toronto.

In its present form, the Lincoln Demand Meter gives a peak load registration and does not belong to the family of integrating watt meters. It can, therefore, be used with any make of meter or added to present installations. The operation of the meter is based on the expansion of a bi-metallic strip which causes a pointer to move across the scale in true proportion to the watts supplied to the instrument. For simplicity of explanation, the modus operandi of a single-phase meter is given; the three-phase instrument differs only to the extent of employing a double set of coils and heaters.

The current coil, with a tap taken from its centre, is wound over the potential coil. The load current is taken into the meter by way of this middle tap. The remaining two ends of the current coil are connected to two heaters, which, in turn, are connected together with a tap taken therefrom, which forms the load side of the line wire.

A_1, A_2 , current coil; B_1, B_2 , potential coil; C_1, C_2 , back heater; D_1, D_2 , front heater; E , back bimetallic spring; F , front bimetallic spring

The two heaters are placed adjacent to two bi-metallic springs. These springs are wound in the form of heavy hair-springs, and are mounted on the spindle, one in a clock-wise and the other in an anti-clock-wise manner. Thus, when potential only is applied, the current coil becomes a closed secondary of a transformer in virtue of the two heaters being in series, but as soon as the load is applied, the load current is superimposed on the current due

*If we represent the current that passes through the combined resistance of C and D in Fig. 1, due to the presence of the voltage, by E , and the load current therein by I , the resultant current in one of these resistances is $E + I$ and in the other $E - I$. The losses are proportional to the squares of these currents and the difference in these losses are proportional to the product $EI \cos \phi$. This holds true independent of power-factor or wave form; that is, the meter is a true wattmeter.

to the application of potential on the primary of this transformer; this results in the following formula:

$$(E+I)^2 - (E-I)^2 = EI \times \text{Constant}^*$$

This results in the following mechanical action. When voltage only is applied the current passing through the heaters is the same. Therefore the heat action on each of the two bi-metallic springs is the same and, as they are mounted on the spindle opposing one another, no movement of the pointer takes place. By the application of the above formula, as soon as current is applied, a difference in the current flowing in the two heaters is set up in true proportion to the watts applied, resulting in one spring being heated to a greater degree than the other. This results

Fig. 2—The Lincoln Meter Complete

in an unbalanced expansion, causing the pointer to rotate until the spring reaches a point of balance.

The utilization of two springs has another advantage, namely, it takes care of variations in external air temperatures; this change in air temperatures causes equal and opposite pressures from the bi-metallic springs with no resultant movement of the pointer. Temperature tests have been taken on the instruments and show on a range of from minus 10 degrees F. to plus 125 degrees F., an error of not more than 3 per cent., which bears favorable comparison with the average integrating watt meter.

Two pointers are provided, one being called the maximum pointer, remaining at the maximum load applied in any given period and the other giving the true logarithmic average for the immediately previous period.

The meters are at present built self-contained for 500, 200 and 100 voltages, 5 ampere capacity only. The principle of the meter being based on the logarithmic curve means that the nominal time period is of purely arbitrary definition. The meter that is now being built has been called a 10-minute time period, which means that the indication is 90 per cent. of the applied load at the end of 10 minutes, 99 per cent. at the end of 20 minutes, 99.9 at the end of 30 minutes, and so on, ad inf.

The Lincoln Demand Meter is essentially a Canadian product. In appearance and detail of manufacture, it is surpassed by no other high-grade electrical instrument on the market. Users of electrical appliances in Canada have, perhaps, been too much inclined in the past to make unfavorable comparisons of Canadian products with those produced in foreign countries. However, an intimate and critical examination of the Lincoln Meter will indicate that no effort has been spared to make it equal to anything that has ever been placed on the market. The tool equipment for the manufacture of the meter required much experiment and skill, and some seven thousand dollars have

been spent in the design of the proper machine equipment for the production of the meter in quantity. The aim has been to get the best tools and jigs that money could buy, so that a high-grade article might be produced at a reasonable price. As the meter is 75 per cent. a press job, the tools are, for the most part, punches and dies of very accurate and, in some cases, extremely delicate design. Of the 146 parts entering into the composition of the instrument, the only parts that are not made in Canada are the glass covers, the winding of the potential coils, the hair spring for zero, and the raw material for the bi-metallic springs.

Accuracy is the prime requisite of this instrument and the factory processes are such as to ensure a high degree of accuracy in the assembly of the composite parts. The pairing of springs and heaters fundamentally determines the meter's accuracy, and in the Lincoln Meter Co.'s factory, special means have been developed for co-relating springs and heaters that are absolutely accurate and simple withal. Another process in the manufacture of the meter that contributes to its final accuracy is the oil tempering of the bi-metallic springs. The springs are kept in an oil bath

at a pre-determined temperature, which is maintained for several days with only a fraction of a per cent. variation, by electric thermostatic and time clock control. Even in the rougher operations, such as grinding of castings, it has been possible to work to a .002 inch limit. In testing the meters, they are calibrated against a master meter at full load and at zero, and are thus, of necessity, accurate at all other loads.

It is felt that the field for this instrument will be very considerable, because in Canada it has become almost general practice to have some form of charge which is presumed to be based on the demand. Such systems are in stalled capacity, floor area, ratable value, etc. Generally speaking, these systems have been adopted because of the lack of any instrument which can be obtained at anything like a reasonable price and which will give consistently reliable results. It is felt that this meter should be a profitable investment for a supply company on all loads of 5 kw. and over. At some future date when the production costs warrant, it is the object of the company to reduce the price to an absolute minimum, so that its use may become as nearly universal as possible.

Here is the Answer to All Your Troubles

One Hundred and Sixty-Two Items to Choose From—They are All Electric—If You're Looking for a Suitable Christmas Present, It's Here

FOR WIFE OR MOTHER

Any one of these electrical gifts will make her life easier and happier every day.

Coffee Urn	Percolator
Cleaner	Portable Sewing Machine
Desk Lamp	Range
Disc Stove	Sauce Pan
Egg Boiler	Sew Motor
Fan	Table Lamp
Fireless Cooker	Tea Pot
Floor Lamp	Toaster
Grill Stove	Waffle Iron
Home Wired	Water Kettle
Iron	And many others
Kitchen Motor	

FOR HUSBAND OR FATHER

Some sensible, serviceable electrical presents which are sure to please

Auto Foot-Warmer	Flash Light Cane
Auto Heated-Gloves	Flash Light Umbrella
Auto Heated-Grips	Hand Lamp
Auto Horn	Illuminated Mirror
Auto Search Light	Immersion Heater
Auto Trouble Lamp	Radiator
Battery Lantern	Phonograph Motor
Cigar Lighter	Portable Floor Lamp
Desk Lamp	Shaving Mirror
Drink Mixer	Shaving Mug
Engine and Carburetor Heater	Writing Desk Lamp
Fan	And many others

FOR YOUNG WOMEN

Electrical gifts which young women will appreciate more than something "pretty" but impractical.

Boudoir Iron	Fan
Boudoir Lamp	Hair Dryer
Chafing Dish	Hair Sings
Comb and Curling Iron	Massage Vibrator
Corn Popper	Piano Lamp
Developing Lamp	

FOR YOUNG MEN

Worth-while electrical gifts for young men which they will like because they are useful.

Alarm Clock	Heating Blanket (for outdoor sleeping)
Bed Lamp	Scarf Pin (Electrically Lighted)
Desk Lamp	Shaving Mirror
Developing Lamp	Shaving Mug
Fan	Pocket Flash Light
Flash Light Fountain Pen	And many others
Flash Light Pencil	

FOR ELDERLY MEN

Electrical presents which will make the last years of their lives happier and brighter.

Bath Cabinet	Heat Pad
Ceiling Clock	Immersion Heater
Cigar Lighter	Radiator
Fan	Reading Lamp
Hearing Device	And many others
Heating Blanket	

FOR LITTLE BOYS

Modern toys for little boys which are educational as well as entertaining.

Bells and Buzzers	Telegraph Set
Bicycle Lamp	Telephone Outfit
Boat	Toy Automobile
Dark Room Lantern	Toy Construction
Engine	Toy Motor
Experimental Set	Toy Railway Outfit
Ferris Wheel	Wireless Outfit
Flash Light	And many others
Picture Projector	

FOR ELDERLY WOMEN

Really practical electrical gifts for elderly women which will comfort and cheer them each day.

Foot Warmer	Table Clock (Electrically Lighted)
Hearing Device	Violet-Ray Apparatus (soothes, stimulates and invigorates)
Heating Blanket	Writing Desk Lamp
Heat Pad	And many others
Illuminated Table Ornament	
Medical Coil	
Regulating Lamp or Socket	
Tea Pot	

FOR LITTLE GIRLS

Presents which will educate and amuse.

Candelabra	Doll House (Electrically Lighted)
Candle Battery Lamp	Electrical Toys
Christmas Tree	Toy Range
Lighting Outfit	And many others

FOR THE HOME

Practical electrical presents which will make the home a cleaner, more convenient and better place—lessening the labor and increasing the happiness of those who do the housework.

Air Heater	Heat Pad
Alarms (Burglar and Fire)	Home Telephones
Bread Mixer	Hot Plate
Broiler	Ice Cream Freezer
Casserole	Illuminated Street Number
Cereal Cooker	Iron
Chimes and Bells	Ironing Machine
Cleaner	Kitchen Utility Motor
Clocks	Knife Sharpener
Coffee Mill	Liquid Mixer
Combination Cooker	Modern Fixtures
Convenient Outlets	Oven
Decorative Lamps	Phonograph Motor
Disc Stove	Plate Warmer
Dish Washer	Player Piano
Door Bell	Radiators
Dough Mixer	Refrigerator
Egg Beater	Silver Polisher
Egg Cooker	Thermostatic Furnace Control
Fans	Vegetable Slicer
Fireless Cooker	Ventilating System
Floor Polisher	Waffle Iron
Floral Decorations	Washer
Food Chopper	Water Heater
Food Warmer	Water Purifier
Frying Griddle	Water Supply System

Pole Pulling and Straightening Jack

Templeton, Kenly & Company, Limited, 1020 South Central Avenue, Chicago, Ill., manufacture a jack called the No. 328 Simplex Pole Pulling and Pole Straightening Jack, which is built for the express purpose of pulling and straightening poles for telephone, telegraph, electric light, power and railway companies, municipalities and other public utilities having pole equipment. It is claimed that with this jack one or two men can pull the largest pole whatever the depth, soil or season conditions, in a frac-

tion of the time taken by the usual gang of five or six men, and also that one man, with this tool, can straighten a pole in much less time than it takes several men to do the same job in the ordinary way. The Simplex jack is constructed of the best materials, along rugged lines, and in its design the makers have endeavored to provide absolute safety to pole, overhead lines and operator. A similar jack to the Simplex No. 328 is the No. 310 Emergency Jack, which the company claim is adapted to an almost unlimited range of general utility service, as its many attachments enable it to be applied to almost every object that needs to be pushed or lifted.

Christmas Toys

The Masco Company have a fine selection of Christmas toy equipment in their Lionel line. The toy trains are a particularly complete selection—everything required in the operation of a railway system; transformers, motor and locomotive parts, current reducers, semaphores, lamp posts and lamps, switches, tunnels, station houses, straight and curved tracks, cars and trucks—everything to delight the eye and the heart of the Canadian boy. There is no

more attractive display for the Christmas window than one of these trains in actual operation. It will attract crowds—and customers—where the "still" window will fail. Added to this is the boys' extreme satisfaction in the ownership of one of these outfits. It is an all-the-year-round remembrance of the one best day in the year.

Nor should we forget that the electric train, unlike most mechanical toys, is a source of continual knowledge. The boy learns as he plays, and continues to learn as long as he plays.

Current News and Notes

Bowmanville, Ont.

The Hydro Radial by-law for \$216,030 has been passed by the ratepayers of Bowmanville, Ont.

Brantford, Ont.

A Dominion charter has been granted to the Robbins & Myers Company of Canada, Limited, Brantford, Ont.

Bridgeburg, Ont.

The Reliance Fuse Company of Canada, Limited, Bridgeburg, Ont., have been granted a Dominion charter.

Brockville, Ont.

A meeting of municipal electrical representatives, in Eastern Ontario will shortly meet in Brockville to form an Eastern Hydro-electric Association for the purpose of giving support to Sir Adam Beck's plans to secure full development on the St. Lawrence River.

Campbellford, Ont.

The Hydro-electric Power Commission of Ontario will commence work during 1920 on the development of 10,000 h.p. at Ranney's Falls, near Campbellford, Ont. Power from this plant will be supplied to Peterboro and surrounding territory.

Darlington Township, Ont.

On December 13th the ratepayers of Darlington Township will vote on the \$429,680 Hydro Radial by-law.

Fort William, Ont.

Fire recently destroyed sixteen cars, the car barns and other equipment of the Fort William Electric Railway. There were twenty-three closed cars operated by the city, five of which were saved and two can be repaired. Several Port Arthur cars have been loaned and an almost normal service is being maintained, except in rush hours. The company have already commenced rebuilding the barns, and an attempt will be made to convert the open summer cars into closed cars, in addition to purchasing a number of second-hand cars from other cities in which they are available. The cause of the fire is apparently unknown.

Guelph, Ont.

Mr. W. H. Breithaupt, president of the Waterloo and Wellington Railway, of Kitchener, has submitted a proposal to connect Guelph and Kitchener with a line that will run through Bridgeport, Bloomingdale, New Germany and Marden, coming into Guelph over the Elora road line. The length of the road will be fifteen and a half miles, and the cost \$280,000, bonds to be guaranteed by the two cities in equal amounts.

Halifax, N. S.

Work will start at once on an extension to the Halifax Tramway lines on Cogswell street between Gottingen and Quinpool road.

Hamilton, Ont.

The ratepayers of Hamilton, Ont., will vote in January on the expenditure of \$50,000 for an underground fire alarm system. A government order calls for all overhead wires in the central districts to be removed and placed underground within six months after the proclamation of peace, and it is necessary that this step be taken if the Dominion Power and Transmission Company and the Bell Telephone Company are forced to do likewise.

Hampton, N. B.

The ratepayers of Hampton, N. B., are endeavoring to have the town council proceed with the work of instal-

MONTREAL

Branches : Toronto, Winnipeg, Regina, Calgary, Vancouver

ling an electric lighting plant to be completed some time during the coming year.

Lakefield, Ont.

The ratepayers of Lakefield, Ont., have passed a by-law authorizing the village council to enter into an agreement with the Hydro-electric Power Commission of Ontario. Power will be transmitted from the Auburn development at Peterboro.

Lake Temiskaming, Que.

M. J. O'Brien, Limited, Ottawa, Ont., contemplates the construction of a hydro-electric development on the Quinze River, near Lake Temiskaming, Que., to supply a pulp and paper mill which is also to be erected in 1920. Kerry & Chace, Limited, Toronto, are consulting engineers on the proposed work.

London, Ont.

The ratepayers of London, Ont., will vote at the January elections on the question of purchasing the London Street Railway.

The London & Port Stanley Railway Company have outlined the following work to be done in 1920 at the Port Stanley end of the line: Ship dock, freight sheds, \$2,500; steam heating system for depot, \$4,500; extensions to sidings, \$14,000; comfort station, \$4,000; store room, \$6,000; extensions to present buildings, \$4,500; lockers, \$1,500.

Work on the valuation of the properties of the London Street Railway Company is being carried forward by the Hydro-electric Power Commission of Ontario.

An electrical contracting business has been opened at 536 Elizabeth Street, London, Ont., by G. E. S. Pettett, who was for four years overseas with the C. E. F.

The Electric Motor Repair Company have opened premises at 349 Talbot Street, London, Ont., for the repairing of motors and the electrical equipment of automobiles.

Montreal, Que.

The Quebec "Gazette" announces the incorporation of the Ideal Washing Machine Company, Limited, with a capital stock of \$25,000. The head office is at Montreal.

The Electric Machinery Company, Limited, Montreal, has been granted a Dominion charter.

New Liskeard, Ont.

A report states that electrification of the Temiskaming and Northern Ontario Railway has been considered at a cost of between five and six million dollars.

Oshawa, Ont.

The Hydro Radial by-law has been passed by the ratepayers of Oshawa, Ont.; amount, \$771,894.

Ottawa, Ont.

The G. N. W. and C. P. R. telegraph companies have applied to the Government for an increase of approximately 20 per cent. in rates. Both companies claim to be operating under heavy deficits and that relief within the next year is absolutely necessary.

Pickering Township, Ont.

The ratepayers of Pickering Township have passed the \$482,050 Hydro Radial By-law.

Port Arthur, Ont.

The Great Lakes Paper Company, Limited, a new industry in Port Arthur, have signed a contract with the Hydro-electric Power Commission for a supply of 16,000 horsepower at \$17.50 per h.p. delivered. This power will be generated at the new plant on the Nipigon River, some 65 miles from Port Arthur and transmitted at 110,000 volts.

Preston, Ont.

A meeting of the electors of the town of Preston was held on November 24, at which Sir Adam Beck and Chief Engineer Gaby of the Ontario Hydro Commission were the

speakers. Their subject was the proposed Hydro radial between Elmira and Hamilton.

Scarboro Township, Ont.

The ratepayers of Scarboro Township passed the Hydro Radial By-law on November 22, the amount of which was \$892,686.

Smiths Falls, Ont.

For many years the water supply of the town of Smiths Falls has been furnished by a steam pumping plant. The installation of three electric pumps, however, now enables the town to dispense with the steam plant entirely. Two of these pumps will be in continuous operation, while the third will be used as a booster in case of fire. The old steam pump will be kept in order to take care of any unexpected emergency.

St. Louis de Champlain, Que.

Work has started on the installation of an electric lighting system at St. Louis de Champlain, Quebec. Power will be supplied by the North Shore Power Company.

Toronto, Ont.

The Canadian General Electric Company recently announced their intention of placing an additional million dollars of capital stock on the market.

A newspaper report states that a scheme is under way to develop power at Indian Chutes, on the Montreal River, a short distance north of Elk Lake, where there is said to be an amount of between 4,000 and 5,000 horsepower available.

The Board of Control, Toronto, have recommended that a by-law be submitted to the ratepayers at the January elections on the question of authorizing an agreement with the Hydro-electric Power Commission of Ontario for the construction of a radial railway between Toronto and Bowmanville. Toronto's share of the proposed expenditure of \$8,360,794 is \$4,328,665. The proposed route will cover a mileage of 43.5 and the estimated capital cost is made up as follows: Right-of-way, grading, track and overhead, \$6,510,794; rolling stock, car barns, etc., \$1,830,000. It is estimated that the annual revenue will be approximately \$1,118,003, made up of \$873,140 from passenger traffic, and \$244,863 from freight. The operating expenses are estimated at \$1,076,175. The balance of the capital cost is to be borne in the following proportions: York Township, \$381,587; Scarboro Township, \$892,686; Pickering Township, \$482,050; Whitby Township, \$277,955; East Whitby Township, \$299,943; Carlington Township, \$429,680; Town of Whitby, \$277,955; Town of Oshawa, \$711,894; Town of Bowmanville, \$216,030.

Tenders will be called by the Department of Works, Toronto, shortly, for new electric pumps at the main water-works pumping station.

Windsor, Ont.

It is reported that the electrical contracting firm of Hutzel and Buehler, incorporated under the laws of New York State, will open Canadian connections with an office at Windsor, Ont.

Winnipeg, Man.

Work has been completed on the city of Winnipeg's new line to the Scotland Avenue station in Fort Rouge. This is one of the links in the new transmission line between Winnipeg and Portage la Prairie, the construction of which will proceed throughout the winter.

The establishment of a wireless telephone system throughout the settlements in Northern Manitoba, at an estimated cost of from \$25,000 to \$30,000, will be recommended by Professor R. G. Wallace, Commissioner for this territory.

Cozy Glows Are Silent Salesmen

Mr. D. M. Mackie, Commercial Engineer of the Springfield Light, Heat and Power Company utilizes the cheery heat of the Westinghouse Cozy Glow Radiator in an effective manner in his electric shop, which is in connection with the offices of the company.

A Cozy Glow on a nearby table is permanently connected and its heat is so directed as to strike the faces of the customers as they pass by to pay their light bills. Their attention is thus forcibly directed to the Cozy Glow in operation, and to the attractive display of other heating appliances grouped about it on the table.—Contact.

City of Saskatoon

Sale of 750 K.W. Generator Set

The City of Saskatoon invites offers for the purchase of the following electrical machinery:—One 26" x 48" x 30" Roll Armstrong Vertical Cross Compound Engine, direct connected to 750 k.w. General Electric, 2 phase, 2300 volt, 60 cycle Generator, complete with surface condenser, air pump, etc.

This unit is being offered for sale in order to provide room for a larger set, is in first class running condition, and can be shown in operation at the City Power Plant.

Tenders to be delivered to the undersigned on or before 12 noon on Friday, the 12th day of December, 1919.

C. J. YORATH,
23 City Commissioner.

Accident Prevention and the Balance Sheet

Most operators of public utilities are very anxious to make a good showing as to the earnings of their properties, and properly so. Money paid for repairs to machinery, inefficiency of man power, interruption of service and supplies consumed is reflected in the general cost of operation and the net gain or loss. What of the money paid out for the accidents? Can this be honestly charged against necessary operation? There are companies which do not have serious accidents, and it therefore must be logical to the companies which do have them that they can be prevented. The question is, how can this be done?

We will divide the accidents into two classes: the inevitable and the preventable. Inevitable accidents do not result from the neglect or carelessness of any one and the loss occasioned thereby, which is very small, must naturally be charged up as part of the cost of production. Preventable accidents are caused by some one and constitute a large percentage of all accidents. While it is necessary for financial reasons to charge preventable accidents to operation, they should properly be charged against the superintendent, foreman or other employees who caused them.

As we have all heard many times, there are two sides to an accident when it occurs, first the humanitarian, in which the employee is the one vitally interested, and then the financial, in which the employer must be vitally interested, for when a fatal or serious accident occurs, he must pay the cost to the man injured and also replace him with a new man whom it will take time to train.

Most companies have sufficient rules for the safe operation of their property, but the fault often lies in the enforcement of these rules. Before accident prevention work becomes successful, it must be dealt with as an operating and business proposition. It is too often a fact that large companies employ a safety engineer and expect him to eliminate the accidents on their property without any assistance or co-operation on the part of the management or employees. Under these conditions the safety work will fail, as would any other department in the company. Often the safety department is looked upon as a side issue, which can be carried on when there is nothing else to do.

There are two doors leading out of industry. One turns out the finished product ready for the market. The other will turn out either cripples and hopeless wrecks or strong, healthy and contented men. Which does your plant strive to do?—N.E.L.A. Bulletin.

A Wastepaper Box that Makes Cleaning Easier

In the course of a day every store becomes more or less littered up with waste paper, empty boxes and other waste material, a condition which, of course, requires prompt attention in order to keep the store clean and attractive.

An arrangement which has become of considerable value in speedily disposing of such accumulated litter consists of a trap door 10" x 12" in the floor near

the wall. Directly beneath this trap door a piece of steel furnace pipe is attached to the floor and extends down to within four feet of the basement floor; immediately under this pipe is placed a fire-proof metal container into which the litter falls after being swept into the pipe leading from the trap door. The door used for this system is scarcely noticeable.—Contact.

Turning Kickers into Boosters

The slogan of the Urbana (Ill.) Light, Heat and Power Company is "Service." "This does not mean simply electric ser-

vice," says John A. Glover, General Superintendent, "but means service in the larger sense. One important detail is the prompt handling of all complaints. Every complaint must be fully satisfied at once if it is possible. If it is not possible, the complaint is recorded in a complaint register where it cannot be overlooked. The general superintendent personally examines every complaint and writes the customer a letter telling him the result of the investigation.

"This courtesy is much appreciated by our customers and has resulted in an immense amount of goodwill."—Contact.

SALE OF Military Stores, Etc.

Dry Goods, Hospital Furniture,
Bedding, Hardware, Leather
Goods, Junk, Etc.

SALES WILL BE MADE BY SEALED TENDERS

Persons desiring to tender are requested to register their names and addresses with the

Secretary of the War Purchasing Commission, Booth Bldg., Ottawa

stating the class of goods in which they are interested, whether new or second-hand or both.

Tender forms with full details of the goods and places at which samples may be seen, will be mailed when ready to those who have registered as requested above.

Special Terms to Hospitals, Etc.

Dominion, Provincial, and Municipal departments, hospitals, charitable, philanthropic, and similar institutions which are conducted for the benefit of the public and not for profit may purchase goods without tender at prices established by the War Purchasing Commission.

Returned Soldiers and Sailors and Widows and Dependents of Soldiers and Sailors killed in the War may obtain supplies, for their own personal use and not for re-sale, through the nearest branch of the Great War Veterans Association who will combine individual orders and forward to the War Purchasing Commission through the Dominion Command of the Great War Veterans Association. These services are rendered by the Great War Veterans Association to all parties in the classes named, whether members of the Great War Veterans Association or not.

All communications should be addressed to the Secretary, War Purchasing Commission, Booth Building, Ottawa, who will be glad to supply lists and further details to those interested.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

"American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$4.00.

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$2.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price \$1.50.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$2.50.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$2.50.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 295 pages, illustrated. Price \$2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price 50c.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$5.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electric Power Transmission, Principles & Calculation, by Alfred Still. 2nd Edition, revised, enlarged and rewritten. Just published by McGraw-Hill Book Co., Inc. 407 pages, illustrated. Price \$4.00.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price 75c.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 50c.

"Elements of Radiotelegraphy," by Ellery W. Stone. Recently published by D. Van Nostrand Company, 267 pages, 125 illustrations, 33 plates. Price \$2.50.

Examples in Alternating Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$1.50.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price \$1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

"Governors and the Governing of Prime Movers," by W. Trinks. Recently published by D. Van Nostrand Company. 236 pages, 140 illustrations. Price \$3.50.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

Induction Coils in Theory and Practice, by Prof. F. E. Austin. Published this year by the author. 64 pages, illustrated. Price \$1.00.

International Library of Technology, Vol. 11.B, on Electricity and Magnetism, Electrodynamics, Electrical Resist-

ance and Capacity, The Magnetic Circuit, Electromagnetic Induction, Chemistry and Electro-Chemistry. Primary Batteries, Electrical Measurements, 585 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

International Library of Technology, Volume 14-C on Storage Batteries, Incandescent Lighting, Arc Lighting, Interior Wiring, Modern Electric Lighting Devices, Electric Signs, Electric Heating, 540 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

"Powdered Coal as a Fuel," by C. F. Herington, recently published by D. Van Nostrand Co. 211 pages with 84 illustrations. Price \$3.00.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.00.

Standard Wiring, 1919 Edition, 25th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price \$2.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.

"The New Competition," by Arthur Jerome Eddy, 6th revised edition, price \$1.60.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 50c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price 75c.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.25.

A Time and Labor Saving Screw for Electrical Contractors

Patented Robertson *Socket Head* Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

ACQUAINT US WITH YOUR REQUIREMENTS

You Know the Noise!

caused by commutators sparking and flashing—the result of undue friction between brushes. This trouble can be cured by fitting your machines with

No-Spark Carbon Brushes

They run smooth, do away with the continual cleaning, replacing and resetting because these brushes are frictionless and self-lubricating. Try "NO SPARK" Brushes. Other engineers are enthusiastic over them. Why not you?

THE G.C.A. Lamp Replacer

Patents in U.S.A. and Canada

IT saves 50% in time in removing and replacing bulbs. It eliminates all possibility of accident by doing away with pole climbing, the use of ladders, etc.

It is not an experiment. Its value has been proved. It has been adopted as part of the regular equipment by hundreds of Light and Power Companies.

It is made in two types, for either series or multiple lamps. The length of the pole can be easily changed to meet the required height. The mechanism is made of aluminum, being light in weight and substantially constructed.

Write for catalog and full information.

Export: ARCHER & BALDWIN, Inc., 114 Liberty St., New York

UNIVERSAL BUSHINGS FOR FLEXIBLE TUBING

Neat, Secure and Accessible

Nos. 1 & 3

They grip the flexible tubing securely. Can be installed in a moment by simply slipping over the tubing. Fits "knock out" tightly. Permits easy removal of flexible tubing for inspection without dismantling switch box or injuring bushing or tubing.

Nos. 2 & 4

Universal Bushings

combine function of porcelain, bushing and tape, and give the job a finished mechanical appearance. Try them and be convinced.

Approved by the National Board of Fire Underwriters

If You Build Motor Driven Machines

Wagner, Quality

The motor should not be less in quality than the machine. And it should be exactly suited in characteristics and horse-power to give the machine the best possible performance.

You can get the **Wagner, Quality Motors** that will meet all these requirements. The experience of the Wagner Company in this direc-

tion, whether for very large or very small machines, will be valuable to you. The reputation of the **Wagner, Quality Motors** will help to sell, and keep sold, your products. Send for Bulletins 11713 and 11813.

Wagner Motor driving floor polishing machine

ECONOMY renewable FUSES

are the *right* fuses to protect *your* electrical circuits—

- because they afford the right sort of protection; their reputation lends assurance that you can safely depend on them for accuracy of rating and all-round efficiency in operation.
- because they cut annual fuse maintenance costs 80% as compared with the use of one-time fuses, owing to the fact that an inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.
- because it's the work of a moment to replace the link and renew the fuse.
- because a good sized stock of "Drop Out" Renewal Links always on hand represents but a small outlay.

*Give It
the
Emery
Wheel
Test*

**Spaulding
HARD FIBRE**

Put a sheet, rod or tube of Spaulding Hard Fibre in contact with a revolving emery-wheel. Note how slowly, how finely, how evenly it grinds down. Observe its compact, closely knit, horn-like composition that improves with age and will outlast the machine or product on which it is used.

A Universal Material

Its electric rupture is 200-400 volts per 1/1000 in. of thickness; tensile strength 10,000-20,000 lbs. per square inch; shearing strength 9,000-13,000 lbs. per square inch. It can be machined, sawed, stamped, bent, threaded, drilled and finished in many attractive ways.

Made in red, black and grey colors. Send for samples. Our Specialty Department is equipped to machine special parts to your own specification.

BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

Cora Diffusing Domes for Dining Rooms

The Demand of the Day

Wherever there is a home today there is someone who appreciates Beauty. Electrical Merchants are finding that Quality brings greater sales than ever before.

This in part is perhaps the reason for the big growing sales of the "Cora" Diffusing Domes for Dining Rooms.

The "Cora" domes are a specialized fixture of beauty to meet this beauty demand of today. Snow-white "Cora" Glass etched and tinted as desired. The lamps are concealed, all rays are diffused. The strongest light is concentrated on the table. Its efficiency is as great as its beauty. Can you imagine a more ideal lighting effect for the dining room?

Let us send you prices.

Walger CONNECTORS

Enlarged
Phantom
View.

Walger 3-Way

Use it to tap feed wires in outlet boxes, Condulets and on knob and cleat work. Saves time, cuts costs.

Actual Size.

What is the cost of making connections on your jobs?

THE cost of making connections must be considered as carefully as the cost of material.

When you use Walger Connectors, all the connections on the job are completed in one-fifth the time at one-half the cost. A fact you can profitably prove on your very next job.

And best of all, every Walger-made connection is perfect; substantial, tight, and absolutely insulated.

Approved by

by the National Board of Fire Underwriters and the Hydro Electric Power Commission for No. 12 and all small wires.

Send for Samples

Phantom view—actual size.

Walger 2-Way

When there are two wires to be connected you can do it quicker, cheaper and better with Walgers.

"Just What I Want"

This is exactly what you, or any one else, will say after having bothered around with loose extension cords.

The Automatic Extension Reel

for Electric Lamps

Obviates the necessity of dragging your cord over the floor, thus wearing out insulation and breaking sockets, guards, etc. Takes your light just where you want it, locks at any point, and automatically rewinds your cord when you are through with light. Contains 25 feet of approved reinforced weatherproof cord.

Approved by the Underwriters, and endorsed by fire and electrical bureaus everywhere. Fully protected by two basic patents and more pending. Write for further particulars and prices.

Electrical Appliances For Christmas

TURN-OVER TOASTER
Turning the knob, turns the toast
No danger of burning fingers.

Westinghouse Type 3-19B Automatic Electric Range.
All parts accessible, and easily removed for cleaning.

Westinghouse Electric Irons concentrate all heat at the ironing surface, radiation from the top being prevented by a dead air space.

Ideal Gifts

Everyone is looking for the kind of Christmas Gifts that last through the years, and are constantly useful.

Westinghouse Electric Ranges, Toasters, Irons and other household appliances quite fill the bill.—They are beautiful to look at, and useful every day in the year,—a constant reminder of the giver.

Ask our nearest office for particulars

Owners of Westinghouse Apparatus are invited to make use of our Service Dept. Repair Shops, where repair work will receive prompt and efficient attention. Repair shops are located at:—

MONTREAL—10 St. Sophie Lane.

**This SOLENOID SWITCH has been adopted
by the Hydro Electric Commission
They use it for
STREET LIGHTING**

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment, by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

A FACT THAT—

Illustrating 1/6 H.P. Motor

Century

FRACTIONAL HORSE POWER

SINGLE PHASE MOTORS

1/10 to 1/4 Horse Power

ARE being supplied as standard equipment by many manufacturers of such apparatus as is usually connected to a lighting circuit because their high starting torque insures starting the load under all but the most adverse conditions, and a fuse which will protect while running is sufficient for starting.

Their low starting current (less than 300% full load current) minimizes voltage disturbances.

Other sizes up to 40 Horse Power

The Essential Details of G & W DISTRIBUTION BOXES

are very carefully perfected

In the primary box illustrated, switch blade action is combined with bolted contact efficiency.

Unit cable potheads with ample compound space make an easy installation without sacrifice of safe, permanent cable end insulation.

The entire box is lined with insulating material—all bolt heads, etc., are covered and different polarities are thoroughly barriered.

In the secondary box double U clips give better contact alignment than would a single U clip.

The unit cable potheads attach at an angle, gaining roominess without using excessive wall space.

The line of this material is complete, offering constructions suitable for all conditions.

Primary Box for 2300 Volt Use

Secondary Box for Low Tension Use.

Electrical News

Generation, Transmission and Application of Electricity

Ward Leonard Resistor Units and Plates have been employed by thousands of users from the largest electrical apparatus manufacturers, to the small farm lighting plant user—millions are in successful service continually all over the world—their permanence has been completely demonstrated. If you have a resistance problem avail yourself of the advantages of our quarter century experience as Resistance specialists.

Ward Leonard Electric Company

Mount Vernon, New York

"Quality Electrical Work"

Two-button Flush type is completely enclosed in a two-piece box made of indestructible insulating material, thereby eliminating breaking, excluding dirt and preventing electrical grounds. The brass bevelled edge cover plate is finished to match the surrounding hardware.

Single-button Flush type Switch is preferred by many for the reason that all combinations of connections are provided in the one style. The operation is by means of successive pushes on a single button.

THERE is a campaign on now for "Quality Electrical Work." And quality electrical work demands superior wiring devices.

The fact that the Bryant line of Superior Wiring Devices is the most used line in Canada signifies that the majority of contractors are already on the side of

Quality Electrical Work

On those contracts where your instructions are "use best materials obtainable"—let the switches be Bryant.

Three favorite types are shown on this page, selected from the immense variety of Bryant Devices that have made themselves standard in Canada whenever first class wiring work is considered. Enhance the reputation of your firm for Quality Electrical Work by tying up to Bryant Wiring Devices.

In stock at all our Houses

Angle Dial Heater Switch, mica insulated. The advantage of this construction is that the switch can be placed in locations from which the dial of the ordinary switch would not be visible.

STOP! LOOK! LISTEN!

Stop

to consider Mr. Manager, what it means to have meters which will give the maximum amount of accuracy on minimum current. Why not eliminate that old trouble of having meters which will not register on small loads. The C & H kind are efficient on all loads.

Listen

for that usual complaint this month from those exacting customers of yours. "They did not use that much current" etc., etc. Then investigate their complaint. Then put them in a C & H Meter.

The Reputation is behind it. Our business is built up by satisfied customers and a courteous service.

Ask for Technical Information. It's free.

LOOK at the features embodied in the construction of the C & H Meter. Simplicity, Accuracy and Reliability are the keynotes throughout.

A Time and Labor Saving Screw for Electrical Contractors

Robertson *Patented* Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

ELECTRIC

SUCTION

CANADIANS *for* CANADIANS

WITH The Hoover's new big factory in operation at Hamilton, Ontario, with its 30,000 square feet of floor area entirely given to the complete manufacture of Hoovers by Canadians, The Hoover will rapidly parallel, throughout the Dominion, its United States record for tremendous sales.

National advertising in all leading Canadian magazines supplements the advertising which will circulate in Canada through the medium of twenty-three United States periodicals.

Canadian dealers will have at their disposal the entire array of local publicity helps, the all-inclusive variety of which has created an enviable reputation for The Hoover.

The famous Hoover method of dealer co-operation that has made fortunes for dealers elsewhere, and bars the United States factory from adding new dealers, although output has been *tripled*, will be available for the profit of Canadian dealers.

Be assured that we did not lay foundations sufficient for adding two more floors on our new factory here without knowing from past experience that we would need them.

You will find us all over Canada in a year—why not profit from the outset rather than lose months by delay?

Send for the particulars now and be in on the ground floor!

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Accurate—Rugged—Inexpensive

In factory or field, the Type S set will quickly and accurately measure resistance or locate faults. It will withstand, without detriment to its electrical qualities, the knocks which such a set is bound to get. It is of the Dial Decade Type, and therefore simple to operate. Excellent design plus quantity production enables a low price without sacrificing accuracy—ratio coils 1/20 per cent, rheostat coils 1/10 per cent guaranteed.

The removable suspended coil galvanometer deflects a millimeter per microampere. This combination—accuracy of adjustment of coils, sensitivity of indicator, ruggedness, inexpensiveness—is found only in the Type S set.

PRICE \$75.00

A New Wonder Lamp

Even the original Mazda lamp itself was scarcely a greater development in home lighting than is this tipless new white Mazda lamp!

It is made of a beautiful milky white glass having the appearance of fine chinaware.

When lighted it yields a brilliant yet softly opalescent light that beautifies whatever it touches. All harshness is gone! All the brightness left!

No home lover can see one of these lamps lighted without wanting to take home a whole carton of five. From the socket over the wash tubs to the rooms lived in and loved the most, this new white Mazda lamp will bring out unthought-of possibilities in lighting.

Instantly responding to our national publicity of this new Wonder Lamp, the public has recognized the beauty and better lighting it means to the home. Sales have been ready and rapid.

Now, Mr. Dealer, here is another Mazda service to your customers on which you can cash in. We are out to help you. Why not make it today and profit by the first volume of demand?

REDMANOL

Perfect Moulded Insulation

for example :

Distributor Heads

Where high-tension voltages must be carried evenly, where great heat must be stubbornly withstood, manufacturers of high-powered gasoline engines choose Redmanol for distributor heads. This perfect moulded insulation assures constant and unimpaired distribution because of its extraordinary dielectric strength—a property which increases with age in Redmanol. Manufacturers are invited to take advantage of the splendid research work our laboratory is now doing in finding new applications in which Redmanol is markedly superior.

Redmanol Qualities

Resistance to extreme heat.
Exceptionally high dielectric strength.
Great mechanical strength.
Excellent acid resistance.
Unusual accuracy of dimensions.
Singular beauty of finish.

Redmanol Chemical Products Co.
676 West 22nd Street Chicago, Illinois

Universal Insulator Supports

SAVE
Time, Labor and Material

UNIVERSAL INSULATOR SUPPORTS are specially designed malleable iron clamps made in four sizes for securing Insulators to open steel framework for wiring mills, foundries, shops, bridges, piers, elevated railways, subways, train sheds—and similar structures. They are easily attached, and by their use, electric wiring for lights, motors, generators, cranes, etc., can be installed with a great saving of labor and material.

O-B Type AW3 on Ball of Rail. Beveled terminal is not likely to receive blows. If it does it is less liable to damage. This is the feature that makes possible the 90° welding angle.

O-B Type AW2 on Base of Rail.

90 Degree Welding Angle Is the Secret of Good Bonding

O-B Arc Weld Bonds make a right angle with the rail.

Even an experienced welder fails to get a good job in an angle of less than 90°. The arc follows the line of least resistance—the shortest path to ground. So in an acute angle the arc plays against one side and merely drops hot metal on the other side.

In a right angle the arc plays equally on both sides and effects a strong, permanent union in the corner—the vital spot in rail bonding.

O-B Arc Weld Bond Terminals are encased in a steel sleeve, mechanically and electrically united with the copper in the factory. On the job, the operator welds "Steel to Steel with Steel"—the easiest sort of electric welding.

O-B Arc Weld Bonds may be used with any of a number of the welding machines now on the market.

In an acute angle the arc plays against one side and misses the bottom of the scarf.

In a right angle the arc makes a good weld down in the corner.

O-B Type AW3 Bond.

HESSCO ELECTRIC MFG. CO.

Electrical Devices Which Build Good Will for Central Station Service

Every electrical device on the central station line which gives reliable service is a builder of good will, an active promoter of central station service. And as a rule central stations find that they can recommend devices which are R & M Motor equipped, with assurance that they will give such service.

The R & M Motor is not only insurance of reliable power for the equipment, but it is also the best evidence that the manufacturer is building his outfit on a quality basis throughout.

The Blessing Fruit Juice Extractor is one of the new R & M equipped devices which is creating new business and winning good will for central stations everywhere. The part the R & M Motor has performed in the success of this device is best shown by the following extract from a letter recently received from Mr. C. B. Blessing.

"Before manufacturing any quantity we were told that our extractors positively could not be made to operate satisfactorily on account of the difficulty in getting a satisfactory motor, that is, a motor which would operate under such trying conditions as regards overload, ventilation, and dampness.

"The large quantity of R & M Motors we are using is ample evidence that your motor is giving perfect satisfaction, and in fairness to you we wish to add that a great deal of our success

is directly due to the substantial start you have given us, not only as regards quality of motors but also to your co-operation in other ways."

For similar reasons manufacturers of motor-driven devices for every service are powering their output with R & M Motors. They find this motor insures reliable service, the kind which builds preference for their product. And central stations find for the same reason that they are always safe in recommending devices which are so equipped.

No. 24

Something New in Rates—An 'Member of Family May Use Weekly Dollar Pass

In order to provide cheap carfare for its regular patrons, and at the same time induce a more general use of the street cars, the electric railway company of Racine is now selling a weekly pass, good from early Monday morning until the next Sunday midnight—a full seven days. Every conductor has passes for sale. The pass costs \$1 and is transferable, so that any member of the family can use it. It is good on any street car, at any time of the week, for as many rides as you care to take. All you have to do is to show it to the conductor when entering the car, no need to make changes, pay fares or ask for a transfer.

This company is the first on the continent we believe, to try out this experiment. It believes that the universal use of passes would speed up service by eliminating delays where a large number of people get on the cars and have to wait while someone ahead hunts for change. The plan does away with all question about validity of transfer or tickets in cases where the time of day is involved; it means comfort and efficiency; by removing congestion at the car entrance it reduces chance of accidents and mistakes; by reducing the work of conductors, it leaves them free to watch out for the safety and comfort of passengers. In introducing this innovation to the public, the company made the following statement:

There is hardly a family in Racine which does not spend more than \$1.00 a week for street car fare.

By using a pass, you will save money if members of your family ride on an average of three times a day. If the husband rides to work and back, and the wife rides

down town and back each day on a pass, the average cost per ride would be hardly more than 3½ cents. It would mean 28 rides for \$1.00.

But, in addition to that, you have the privilege of riding as often as you wish. When it is raining it is often desirable to ride only a block or two; with a pass this costs nothing. The pass will take someone to the theatre in the evening, and to an outing on Saturday or Sunday. By riding to the store to shop, instead of telephoning, the housewife can buy more economically.

Besides the financial saving, the use of the pass does away with the necessity of fumbling for change, asking for transfers, or getting onto cars at transfer points if you prefer to get on somewhere else.

B. C. Technical Association Urging Improvement in Status and Salary of Engineers

The British Columbia Technical Association held its usual monthly general meeting on the 17th November, in the Board of Trade rooms, Vancouver. Satisfactory reports were made on various phases of the Association's activities, and new plans for future action were outlined. The association has taken an active part in endeavoring to improve the status and salary grading of technical men in the Dominion Civil Service, and for several months past has been in constant correspondence with the authorities at Ottawa regarding the matter. Similar action has also been taken with regard to the regrading taking place under the Provincial Civil Service Commission. The committee report at the meeting indicated that while the Provincial Civil Service Association was given an opportunity of conferring through a committee with the regrading authorities, the committee chosen did not contain a representative of the technical men in the service. So while the Civil Service Association might perform valuable functions for the general clerical branches of the service, it appeared that in this instance the interests of the technical men were not being adequately presented. A delegation was appointed which left for Victoria the following day to interview the Civil Service Commissioner on the matter.

A discussion took place on the hitherto inadequate part which engineers and other technical men have taken in public matters, resulting in it being left to non-technical men to occupy public positions, which vested them with control over expenditure of money on engineering and other technical work. A Public Service committee was formed with instructions to work to promote and encourage increased interest among technical men in municipal provincial, and Dominion government affairs.

Industrial Democracy—Every Man a Capitalist

According to ex-President Taft of the United States, who has made a personal study of the conditions surrounding the coal miners' strike, there is, as usual, something of blame on both sides. He cannot agree entirely with the attitude of the employers, while on the other hand the workmen seem to have been seeking a share of "all the profits they had ever heard of," or some such expression. The one undisputable fact seems to stand out, however, that there is need for a little "give and take" on both sides—and the same is true of almost every industrial dispute. The only way to attain any real results seems to be for each side to place its prejudices and bitter feelings in the background for the time being and consent to take part in an open, frank discussion of the whole situation.

Perhaps the one thing that employers forget oftenest is that every human being resents being made into a mach-

ine. He longs for an opportunity to assert his individuality, however insignificant a thing that may be. Hence the big moral effect of giving the employee some voice, however small, in the management of the business with which he is connected. He is now a capitalist—before, he was only capitalized.

We are printing in this issue the first section of a description of an apparently very effective scheme of this "industrial democracy"—this giving the employee a voice in the shaping of his own destinies. In this case the results gained rest largely with the employees. Greater production means bigger earnings for all. Further than that the employees, as a group, profit or suffer together. If there is incompetence, or laxity, on the part of any one individual the loss is distributed. This tends to make every employee desirous not only of doing all he can himself, but of seeing that all fellow employees do the same. The indirect value of the system, therefore, is greater than the direct effect, and it follows automatically.

High costs of living doubtless have a big influence on the present labor situation; also the constantly recurring desire for more pay, but the cause at the root of unrest, if we don't misread the times, is that men want recognition as individuals, want more responsibility. To simply do his duty according to some one else's estimate of that term no longer satisfies the human mind. He is still anxious to do his duty, but he asks that he have a hand in laying out the plan.

Effective Work of "Adequate Outlets Committee"

At a conference, held in Chicago last month, of the "Adequate Outlets Committee" of the National Electric Light Association, it was recommended that electrical manufacturers and others, in showing their electrical devices through printed advertisements, should illustrate them as connected with proper base outlets rather than attached to lighting fixtures as in the past. The idea of course is to educate the public. As long as advertisements show electrical appliances attached to lighting fixtures, just so long will the public believe that that is the most approved way to use them. The picture of an appliance attached to a wall plug will naturally have the opposite effect, namely, it will train the householder into thinking that if he wants electrical appliances he must equip his home with base outlets. It will follow then that the householder will demand these things of his architect when he is building or from his contractor when he is having his house re-wired or having additions made to his wiring equipment.

This is a move in the right direction and the whole electrical industry should take cognizance of the fact. Dealers should be particularly careful that the illustrations in their advertisements are properly designed.

Use Wired-Wireless on Transmission Lines

The Canadian Independent Telephone Association held their fourteenth annual convention in the Carls-Rite Hotel, Toronto, recently. Among the items on the programme was an address by Mr. F. E. Webster of the Noisy River Telephone Co., who urged that advantage be taken of the recent invention, known as "Wired Wireless," by which it was possible to utilize any metal circuit for the transmission of a number of voice messages. It was suggested that the network of hydro transmission lines which cover the Province could be utilized for this invention by the Independent Telephone Companies thus providing them with long distance connection—a feature so much needed to make them independent of the competing Bell system. Mr.

William J. Herdman of the Canadian Machine Telephone Co., Toronto, dealt at some length with the technical side of this question.

The Legislative Committee of the association was authorized to continue the fight to have long distance connections provided over the Bell Telephone System at the regular rates for such service and without extra charge for connection to the local system.

The officers elected for the following year were: Honorary president, F. S. Scott, Brussels, Morris and Grey Municipal Telephone System, Brussels, Ont.; president, Myron A. Gee, Erie Telephone Company, Selkirk, Ont.; vice-president, A. MacLean, Bruce Municipal Telephone System, Paisly; secretary, A. Hoover, Green River; treasurer, F. D. MacKay, Canadian Machine Telephone Co., Toronto.

Court Frowns on Monopoly at Sorel

Mr. Justice Bruneau, in a recent judgment rendered in the Superior Court at Sorel, criticized a commercial coalition which he said had evidently been formed by certain tradesmen of that town for the purpose of raising prices unreasonably, and in a manner opposed to the public good. In the instance decided one hundred per cent. profit was admittedly charged alike for goods supplied and work executed. The court cut down the profit to thirty per cent.

Napoleon Latraverse engaged J. Octavien Peloquin to make certain electric lighting installations in his hotel. No price was agreed upon, and when the work was concluded Peloquin sent in a bill for \$325.82. Latraverse considered the charge was exaggerated and engaged three qualified men to make an estimate of a fair value of the work. They concluded that \$185.08 would be reasonable payment, and Latraverse thereupon offered to pay Peloquin \$200 in full settlement of his account. The offer was refused and Peloquin took action in the Superior Court to recover \$325.82 from Latraverse.

Mr. Justice Bruneau, in deciding the issue, made a detailed examination of the account, which was made up of a charge of \$209.52 for materials supplied and \$116.30 for labor. Defendant, His Lordship said, admitted that these sums included profits of one hundred per cent. under both heads, and the evidence revealed that the time charged for was exaggerated as well as the price. The work was executed in 1918 during which year the Judge said plaintiff had done business amounting to \$20,000.

The price he had charged in this instance was, according to the proof, the current rate at Sorel, which, it was said, had been fixed according to a convention between three electrical contractors in Sorel. This convention, Justice Bruneau said, constituted a monopoly. It was an act which annulled all competition, increased the price of certain things and enabled the parties to the agreement to enrich themselves at the expense of the public. While merchants were allowed to organize for the protection of their common interests, it was conditionally upon the public interests not being unjustly affected by unreasonable profits.

"An understanding such as that which intervened between the plaintiff and the other electrical contractors of Sorel," said Justice Bruneau, "is contrary to liberty of commerce, work and industry, as tending to give them prices higher than what free competition would give."

In the circumstances established by the evidence, the Judge said that plaintiff ought to have been satisfied with the offer of \$200 which defendant made to him in full payment for the work done and materials supplied. Judge Bruneau concluded by placing the value of the plaintiff's work at \$152.01, to which the court would add thirty per cent., which the Judge considered was a fair profit. This made a total of \$197.61, and at thirty per cent. profit would give plaintiff an income of \$6,000.

Electric Spot and Fusion Welding

A Detailed Resume of the Progress and the Present Status of This Valuable Commercial Art—Illustrations of Various Types of Joints (Continued)

By F. Keith D'Alton*

The tests of a weld are rather interesting, since from the appearance of the surface of the metal in a cross section of the weld it is impossible to judge whether the added metal is pure or is full of oxides. The tests consist in hammering and bending sample welds and, in addition, by corrosion, using an etching fluid which will readily attack any oxides present. In performing the corrosion test, the metal is filed and polished to a high finish, and then an etching fluid, consisting of a solution of iodine and potassium iodide in water is applied. This first attacks the oxides, causing pitting, and thereby enabling the observer to determine quickly whether such an impurity is present in too great proportions.

In welding by any process there are two extremes which must be avoided; one is "overlap," Fig. 9, and the other is excessive "penetration," Fig. 10. If our electrode material (metallic) has a low melting point in comparison with that of the metal itself, we get "overlap" and small penetration. On the other hand if our electrode material has too high a melting point, overlap will be absent and deep penetration will result. In just the same way, Fig. 11, too high a current will produce too much penetration and possibly unnecessary stresses, whereas low arc current gives poor penetration, much overlap and a tendency for the electrode to "freeze" to the metal.

The required diameter of the electrode must be carefully determined, since too large an electrode gives an unstable arc and decreases the rate of deposition, while too small an electrode deposits metal rapidly, even before the metal, has been properly liquefied, causing overheating, softening of the electrode and overlap of the added metal on the original material. In welding, heating should be localized to avoid undue disturbance of the structure of the surrounding original metal. For a good weld, Fig. 12, it is necessary to have good diffusion of the fused metal into the work, without excessive stresses or any abrupt line of division. Penetration may be judged roughly by the depth of the arc crater, Fig. 13, but this method can be used only when the welding has been carefully done, as an interruption of the arc while welding will cause a deep crater to be formed, due to the shrinkage of the metal on cooling. To secure good penetration a short arc should be used and the arc travel should be slow. The difficulty of maintaining a steady arc is increased greatly by the presence of strong air currents. It is preferable, therefore, to use a booth to prevent rapid air movement, and also to protect other workmen from the effects of the brilliant rays of the arc. The inside of the booth is usually painted a dull black to prevent arc reflection.

Electric Arc Welding Equipment

In a previous paragraph it was stated that both direct and alternating currents were used for arc welding. Although the accessories are the same which ever current supply we use, the chief piece of equipment for alternating current welding is a single phase high reactance transformer, while the equipment for direct current consists of a carefully designed generator and a more or less elaborate control system. The alternating current equipment at present used has a maximum current capacity of 200 amperes in the secondary circuit, while the direct current apparatus

is built in capacities ranging from 200 amperes to 1,000 amperes, or higher. The reason for this is that the alternating current process is more suitable for welding where 200 amperes is the largest current required, while the direct current system is used for cutting as well, and it is frequently desirable to use a much higher current than for welding.

Direct current systems are of two kinds, namely "Constant Potential" and "Constant Energy." In the constant potential system, a compound-wound generator, driven by any capable source available, is used to supply the current. This machine is designed to deliver current at a constant potential of 60 volts, but since the voltage required at the

arc ranges from 20 volts, for the metallic electrode, to 40 volts for the carbon electrode, a ballast resistance must be inserted in the circuit to cut down the voltage. This ballast resistance gives desirable voltage variations at the arc, but the energy spent in such a resistance is entirely wasted. In cases where several operators are drawing current from the same machine, however, there is no other satisfactory scheme. Branch circuits are run from the main panel to auxiliary panels, each of which supplies an individual operator. On the main panel is placed a main circuit breaker, a contactor, a relay and a dial switch, by means of which the ballast resistance in circuit is set at such a value that the current for welding is kept within desired limits. The operator first sets the dial switch in the position which in his estimation gives the most suitable current for the work he is about to do. He then strikes the arc. If the current drawn be too great, or the electrode freezes to the material being welded, the relay trips out the contactor, then draws it in again and this contactor keeps on functioning until the operator interrupts the arc. It is a signal to him that adjustments are not right. Fig. 14 shows the wiring of the main and auxiliary panels. Each auxiliary panel contains the same controlling equipment as the main panel with the

*Before Toronto Branch A.I.E.E., Nov. 21.

exception of the main circuit breaker, generator field rheostat, field switch and instruments which it is not necessary to duplicate.

For single operator systems, the ballast resistance scheme may be used, but research and experiment have enabled most manufacturers to introduce improvements chiefly in generator design, whereby the machine takes care of voltage variations and the ballast resistance is unnecessary. The

Fig. 14—Wiring of main and auxiliary panels

efficiency of the equipment is thereby increased and the control much simplified. I will attempt to describe in a more or less general way the manner in which these automatically regulated variable voltage generators operate. The designer endeavors to obtain a voltage current characteristic with voltage increasing as current decreases, so that through a given range of operation the output of the generator will be constant. Such a characteristic curve is dotted on Fig. 15. The result is the "constant energy" generator, which is used as a source of supply for the "constant energy" system.

If the reader be fairly familiar with the characteristics of separately excited, shunt, and cumulatively compound wound generators, Fig. 15, he may readily see that a separately excited machine with an additional series field winding, if connected so as to oppose the flux caused by the separate excitation of the main poles, will have characteristics approaching those desired. A machine, operating on this principle was placed on the market several years ago, and has given exceedingly satisfactory results. The excitation is obtained from a small self-excited generator mounted on the main generator shaft, having its field controlled by a suitable rheostat. A generator of this type gives a practically constant output over a limited range of current variation, Fig. 15, Curve A. In order to make the machine equally suitable for higher current values, an adjustable shunt is placed across the series winding. Adjustment of this shunt changes the strength of the series field coils in their differential action on the main field. The shunt is adjusted by means of a switch on the control panel and the operator sets this switch in the desired position before striking the arc. Relays and contactors are not necessary as the dropping voltage characteristic makes it practically impossible to injure the machine by overload. On a short circuit the current does not exceed 120 per cent. of the operating value.

In order to obtain a similar characteristic and at the

same time dispense with the exciter, one manufacturer has placed on the market a self-excited machine of quite unique design. The generator consists of a two pole armature in a frame with four poles of equal cross section and located symmetrically. (A theoretical winding diagram is shown in Fig. 16) The two diametrically placed poles, horizontally, contain only shunt windings, and will be referred to as shunt wound poles. The diametrically opposite poles, vertically, each contain a similar shunt winding and, in addition a differentially connected series winding with taps brought out to the control panel for varying the number of effective turns. At no load two adjacent poles (say left and upper) are of the same polarity and strength, the other two poles are of equal strength, but opposite in polarity. In this way the component voltages induced in the armature coils by the two successive poles (left and top) are additive, and the machine is so designed that, at no load, each component is 30 volts—giving 60 volts at the brushes.

As load increases the differential windings on the poles diametrically opposite, vertically, have more and more effect in reducing the strength of these two poles and thereby reducing the component voltage caused by these poles. This does not affect the two shunt poles, which remain constant, keeping their voltage component in the armature steady at 30 volts. A third brush is used, being placed midway between the main brushes. By means of this brush the constant 30 volt component is used for excitation in the shunt windings. As the current increases and the variable component of voltage is reduced, voltage between the main brushes is also reduced.

If the current keeps on increasing, soon the series winding on the differentially compound wound poles neutralizes the effect of the shunt winding on those poles; the variable voltage component is then equal to zero and the terminal voltage will be equal to the constant component. Further increase in current will reverse these compound wound poles giving a negative variable component, thereby reducing the terminal voltage below 30 volts. By this means, the voltage drops as current increases (Curve B, Fig. 15), and

Fig. 15—Characteristics of various types of generators

we obtain a volt-ampere characteristic showing an approximately constant power output over a given range of current variations.

The generator is designed to give 60 volts at no load, and to reduce this voltage to 20 volts when delivering full rated current. With a short circuit on this generator the current will not be excessive, so that the control is quite simple, consisting chiefly of a dial switch by which the operator selects the number of effective turns in the series

field so that the desired voltage current characteristic is obtained. A volt meter, ammeter, and generator field switch, together with a main switch are also supplied on this panel. The volt-ampere curves, with different numbers of effective series turns are shown in Fig. 17. A machine of this design is now on the market. It is sufficiently rugged to withstand repeated and sudden variations of the load from no load to the short circuit value of current. Tests indicated that the machine does not require any external protection, having such inherent characteristics as will protect it under all service conditions. Two of these generators may be parallel, and they will operate satisfactorily, without an equalizer bus, giving larger currents. Each machine is provided with two interpoles placed between poles with similar polarity at no load. Commutation is sparkless, on the main brushes and very good on the third brush.

In comparing these two types of constant energy generators, it will be noted that, in principle, there is a great similarity. Each has a steady excitation and no adjustable differential series winding. Different methods are used for adjusting the effectiveness of the series winding, but the net result is practically the same. Consequently we expect somewhat similar characteristics, and such we do obtain.

In addition to the constant energy generators, there is on the market a constant energy balancer set consisting of a cumulatively wound d.c. motor direct connected to a differentially wound generator. The two machines are connected in series across a 125 volt direct current power supply and the lines for the welding operation are taken from the generator terminals. This set is suitable for metallic electrode welding only. It is more efficient than the constant potential generator with ballast resistance and cheaper to install than the constant energy generator where the power supply is direct current. Its chief objectionable feature is that it cannot be used on other than a direct current supply.

Alternating Current Welding

Having discussed the features, difficulties encountered and overcome, and the characteristics of direct current welding, we will now consider the alternating current welding processes. These require an alternating current supply at any frequency from $12\frac{1}{2}$ to 500 cycles, the higher frequencies being better than the lower ones, as the arc is more stable.

Fig. 16—A theoretical winding diagram

A special transformer, of high reactance, is used, thereby enabling the transformer to take care of short circuits and giving the desired dropping voltage characteristic. The transformer has several taps so that it may be connected to give currents suitable for the work being done. The whole equipment weighs only 300 to 350 lbs. and is readily portable. No control panel is used as such is not necessary.

The efficiency of one of these transformers ranges from 60 to 80 per cent. Each transformer is designed for use on one phase only, so that in any installation where several

welders are being installed, they should be distributed on the different phases to equalize the load.

Alternating Current vs. Direct Current

We have mentioned that proper polarity is an important consideration; in welding with alternating current we cannot obtain this advantage gained by having the material the positive electrode. Hence for a given arc direct current welding is about 30 per cent. faster than alternating current welding.

The power-factor of the supply for an alternating current welding system varies between the limits of 12 per

Fig. 17—Volt-ampere curves with different numbers of effective series turns.

cent. and 52 per cent. and, consequently, is always low. The intermittent nature of the arc current has an objectionable effect on the lines, causing noticeable unsteadiness of voltage. With the direct current system the motive power may be of any sort. If it be an alternating current electric motor, the effect on the power-factor or steadiness of the supply will be no more objectionable than for any other motor of the same characteristics carrying a similar load. Great skill is required to hold the alternating current arc steady, especially with bare electrodes. In a sense then, the alternating current system demands flux covered electrodes to do the best work, whereas the direct current system will produce good results with the bare electrodes. Interruption of an arc is liable to cause oxidation in the crater. This, combined with the fact that the overall efficiency of the alternating current equipment is low, makes it a more costly process.

The alternating current system does not permit the use of carbon electrodes, and in general the metal in the weld is more porous with alternating current, especially if the frequency be below 60 cycles. The alternating current system cannot be successfully used for cutting.

On the other hand, the alternating current equipment has the advantage of being lighter in weight, and lower in initial cost.

Direct Current vs. Gas

Gas welding is preferable for thin material, whereas arc welding is best suited for the depositing of large amounts of material. In welding on large plates direct current welding produces results equal to gas welding and is cheaper.

The advantages of arc welding over gas welding may be summed up in the following:

- (a) Cheapest method except for thin material.
- (b) No danger from explosions.
- (c) Results are more reliable.

- (d) The gas tanks have to be transported back and forth; no similar procedure is necessary with electric welding.

On the other hand—

- (e) The gas flame does not emit dangerous rays of light and does not give the very intense brightness.
- (f) The gas flame makes a very much neater cut than the electric arc process, on plates of all thicknesses cut.

Comparing the oxy-acetylene and direct current arc processes for cutting plates, the cost is the same up to about $1\frac{1}{2}$ in. thickness. Gradually the cost of cutting by the gas process becomes greater than by the electric arc, until at 6 in. thickness, the former is about 60 per cent. greater than the latter. It is to be understood that this relation will vary somewhat with the type of work, and the skill of the operator. In welding it is found that at about $\frac{3}{8}$ in. thickness the gas process costs are equal to the costs when the arc process is used. As the thickness of the metal increases the gas process suffers by comparison, and from $\frac{1}{4}$ to $\frac{1}{2}$ in. the costs by gas are approximately double that where the arc is used. In general then, the gas

process is more costly than the direct current arc process, except for thin material.

Protection

The electric arc with iron as one or both electrodes emits ultra violet rays which are injurious to the eyesight and also to the body of an operator. As a protection to the eye, a face mask is used which has in it a window through which the operator may observe the action of the arc. This window is fitted with colored glasses, usually two red and one green glass, which stop all ultra violet rays from reaching the eye. On the front of the window is a piece of clear glass which serves to prevent sparks or flying particles from cracking the colored glass. With the oxy-acetylene welding, only a clear glass is necessary to give protection to the eye against flying pieces of metal.

To protect the body, all that is necessary is to have a pair of leather gloves on the hands and tightly woven clothing on the body. In some cases the operator prefers to use a leather apron.

Care must be taken to avoid reflection of these injurious rays, since it is possible for the rays thus to reach a part which was thought to be protected and the effect may be equally serious.

Experiences in Industrial Democracy

Description of Successful Application of an Interesting Internal Government Arrangement in a Large Manufacturing Plant

By F. L. Fluerbach*

NO doubt the most important topic in the mind and on the tongue of every business man to-day, not only in this great country of ours, but all over practically the entire world, is the existing unrest and unfortunate strife between capital and labor. Many of our best thinkers are deeply interested in the solution of this serious problem, feeling that this tide of discontent in its mad rush toward Bolshevism must be stemmed before it reaches the point where it will do a good deal more harm to all mankind than the bloody world-conflict just ended. The various systems under consideration, some old and some new, such as Shop Committees Plan, Employees' Representation Plan, Industrial Relationship and Industrial Democracy, may differ slightly or essentially in their application to practical business, but they all aim toward a better understanding toward representation in industry, which is the problem of the hour with business owners and executives, as well as the workers.

The plan of representation Wm. Demuth & Co. adopted at their factory in Richmond Hill, Long Island, in April, 1917, is that known as Industrial Democracy, introduced by John Leitch, whom most of you probably know as the author of the very interesting book, "Man to Man," which deals with this very important subject, and gives a very detailed and comprehensive description of industrial democracy.

What is "Industrial Democracy".

To have Industrial Democracy is to have some internal plan of government in each industrial plant, whereby the employees may have a direct voice in the formulating of such policies as directly affect their physical, moral, social, and economic welfare, as well as that of their families. This means length of hours, character of work, physical surroundings under which they work, the moral influences that surround them, the freedom of self expression, and the ques-

tion of wages or some form of profit and loss sharing. All of these things vitally affect the employee and his family. Therefore, he must have a voice in their control, if we are to have Industrial Democracy.

Ethically it means a square deal in wages and working conditions. What a square deal in wages means, no living man can definitely describe. Some people consider the living wage as such—if we suppose that this expression can be defined, but under present conditions, and perhaps all future conditions, it appears a certainty that labor will not consider that minimum as a fair wage, nor is there in my mind any justifiable economic or ethical theory which makes it so.

Labor will continue to demand with even greater solidarity and persistence, collective bargaining with regard to wages, hours, working conditions, and all those matters which mutually affect employers and employees, and upon which selfish interests are bound to conflict from time to time. Whatever may be decided, and temporarily accepted as a fair wage and just working conditions will not stay decided, or really be decided, unless worked out in joint man to man conference between representatives of the two sides. This, in short, is the essence of Industrial Democracy—an organization and a spirit in which all concerned shall have effective voice in matters which concern all.

Not a "Class" Issue

The labor problem is much more than a class issue. It has steadily risen to the consciousness of mankind from economics to politics, from politics to ethics, and from ethics to a world issue involving the very safety and sanctity of governments and societies.

Better relations between employers and employees can best be arrived at by granting to the latter a greater share in the consideration of matters with which they are concerned and about which their entire life and existence centre to a great extent.

Labor and capital are meant to be partners, not ene-

*Factory Manager, Wm. Demuth & Co., Richmond Hill, N.Y., before recent congress of the National Safety Council.

mies. Their interests are common interests, not opposed, and neither can attain the fullest measure of success and prosperity at the expense of the other, but only in company and by co-operation with the other. In an accomplishment of this sort the proper relationship of the money-supplying and money-receiving forces would naturally involve industrial peace, which cannot be secured by any conciliation or arbitration scheme thus far practised or tried out.

Such schemes settle disputes, or at least try to settle them, only after they have arisen. Industrial democracy means to settle disputes before they arise and by aiming to reduce to a minimum the development and intensity of hostile attitudes and putting in their place mutual understanding and the effective good-will to co-operate. The full benefits of co-operation cannot be realized unless there exists a spirit of friendliness among those who have come together to work for the common good of all. Not much can be accomplished with a man who persists in believing himself always right, for to him it is the whole human race that's wrong. Co-operation means that individually-cherished ideas must at times be shattered and give way to the will of the majority.

Autocracy Must Go

In the past, the employer, generally speaking, regarded the laboring man simply as a necessary means to the productive process, whom he would buy as cheaply as possible, just as he would make his purchases for materials, endeavoring to make as much profit as possible out of both. Fortunately this attitude is undergoing a decided modification, but on the part of a certain type of employer it is still altogether too prevalent. Two influences are bringing about this rapid change in attitude.

In the first place, employers are discerning more clearly the meaning of loyalty, and now can see that this spirit cannot be obtained through the old autocratic attitude. They are beginning to realize that the growth of their business depends upon the growth of the people in their organization, and that loyalty, like electricity, works only when there is a return circuit.

The big man to-day realizes that up to the present time hands only have been employed, and regrets that he did not see years ago that all the humans in his place had not only hands, but also heads containing brains, capable of adding intelligence to their work, which means a larger quantity and better quality of merchandise. He realizes that he cannot get the activity and co-operation of these brains unless he first assures these people of a square deal, and, therefore, takes a new attitude that co-operation is far better than competition between employer and employee, and that fair dealing is the fundamental and basic principle on which relations between employers and employees should rest.

Waste of Human Resources

In these days of efficiency and economy, we all recognize—or will do so before very long—that the greatest waste in the world is the waste of our human resources, and it is quite natural that we start the big work of economy in our own organization.

Secondly, there is more general recognition of the fact that political democracy without a measure of industrial democracy or self government is somewhat hollow.

The fact that workingmen have been fighting in Europe to make the world safe for democracy helps to suggest the ideal of a better, more thorough and truer democracy at home, and it is generally conceded that the social and economic destinies of our country in the next few years depend largely upon the attitude of the employers toward industrial democracy within their respective establishments.

The workingman desires—yes, demands most emphatic-

ally in some cases—to be considered a human being, to have proper physical conditions surrounding his labor, to secure a sufficient return to give his family the right kind of a home and education.

Realizing the need of a better understanding between our employees and ourselves to stimulate an interest in their work and clear from our industrial pathway some of the difficulties which you all have faced from time to time, we installed, about two and a half years ago, a system of organization government, generally termed and known as industrial democracy.

Took Government as a Type

We took as example the United States Government, which having been established and carried on for more than 140 years, seemed a pretty fair guide. We have a Cabinet, Senate, and House of Representatives. The Cabinet consists of the executive officers of the company, with Mr. Demuth as president of the company, acting as its chairman. This body is not elective, its personnel existing by virtue of position in the organization. It is primarily an executive body, and while it has the power to veto, the same has never been used, there being no occasion for it. It also has the power to initiate legislation, by making suggestions in a message to the Senate or House of Representatives, which, of course, may or may not be accepted.

The Cabinet meetings have before them the bills which have been passed by the Senate and the House, and also the minutes of all meetings and discussions, which give a very clear conception of what is in the minds of our people. The Cabinet deals with the larger and more intimate problems of management, which would naturally come before a meeting of executives. Any desired change affecting employees in the least manner is not framed as an order, but put in the form of a suggestion, stating the reason for same very frankly and clearly, and is sent to the Senate or House. No matter what its fate may be, it is sure of a full and complete discussion from every possible angle, and if the measure be rejected, the executives may rest assured that they have been prevented from issuing an erroneous order and saved from the results thereof.

The Senate also is an elective body. It is made up of about thirty foremen and heads of departments, who are in positions of authority over the workers themselves. It elects a president, vice-president, secretary, and sergeant-at-arms, and standing committees, and special committees as the occasion may demand. Its power and practices are identical with those of the House of Representatives.

One Representative for Each Thirty Workers

The House is the popular body of government, being elected by secret ballot by the whole body of workers. Each department has representation—thirty workers electing one representative, either man or girl. The representatives are supposed to act as counsellors within their departments, receive all complaints and suggestions from their fellow workers, and in turn acquaint them with the doings of the legislative bodies.

The Speaker of the House is elected, and he appoints committees, through whom business is transacted to a considerable degree. Each measure is generally referred to a committee to investigate and report, so that when the time comes for open discussion, all available facts will be at hand.

Meetings of the Senate and House are held weekly and always in the company's time, which we consider very necessary for the success of the undertaking. A set of by-laws has been devised for the use of both bodies by a joint committee, and all their business is transacted in accordance with same. Any question affecting working conditions, safe-

ty, sanitation, wages, piece-work rates, etc., is brought up before either of the three government bodies, and any recommendation decided upon after a careful discussion and deliberation is brought to the next body for their action. No change becomes a law until it has been approved by all three bodies. In that way we believe we have found a much better way of feeling the pulse of our people, in learning what they desire, and in avoiding difficulties rather than curing them, which is usually the case in the ordinary shop committee plan. We do not wait for the trouble to culminate—for the sickness to develop. The men hear the report and progress of their respective departments, learn about the troubles of another department, and are helping their fellow workers in getting over any difficulties that they may experience.

We can clearly see the actual formation of a threatening cloud. The open discussion of any dispute has never failed to avoid accumulation of such clouds and outbreak of storm.

The Adjustment of Wages

Permitting the men to have a say in adjusting their wages removes this perplexing question as a field of dispute. The fairness with which the members of the House have always considered and handled all questions of this sort has been most remarkable, and has come to us with a complete surprise. Our experience has shown us very plainly that people learn to be responsible by exercising responsibility; learn to participate in decisions by participating in discussions—even though the experience may at times seem costly to all concerned.

I will give one little example that will show very clearly how industrial democracy and the wage question work together. Last fall twenty-five men of one of our departments were somewhat influenced by an outsider who had formerly worked for us and was then working for a competitor. He advised them that this would be an opportune time to strike for more money. The matter was brought to my attention. I called the boys together and said to them: "If there is anything that is not satisfactory, bring it up in your House, through your representatives. That is the place to air all your troubles and bring your difficulties. The next day, I am glad to say, the representatives of that particular shop came to the House and presented their case. A committee was appointed to investigate the matter and report at the next meeting. The committee came back with quite a detailed report, after having gone to the office to obtain figures as to the rate of pay a year ago, six months ago, and three months ago, and having convinced themselves of the true facts, reported back to the House of Representatives:

"We do not favor any change of piece-work rates for this department, because we find that the men are absolutely unfair in their demands."

The House voted to accept this report, and the twenty-five men went back to work.

Qualifications for Representatives

Any man or woman is eligible for the position of representative, provided they have the following qualifications:

First.: They must be absolutely on the square, in order that their fellow employees may have undoubted confidence in their fairness and honesty, so that they may be entrusted with any and every mission which should be carried to the House.

Second: They must be able to speak and understand English, so that they may fully understand what is going on at the meetings and be able to report to their co-workers.

Third: They must have been in the employ of the company for at least one year. This gives us the assurance that

the man who knows enough about the institution itself and about the work that he is fairly well qualified to take part in all discussions, by having some fundamental knowledge of the business as well as of his co-workers. This also excludes the possibility of having a labor agitator come into the place for a short time to have himself elected as representative.

We have a large sign hung up in our meeting room reading: "We come here not to convince or convict, but to understand," and while this served as a gentle reminder during the early stages of the game, it has become such a definite habit that this sign to-day is more ornamental than necessary.

(Concluded in next issue.)

Surtax on Public Utilities

The Administrative Commissioners of Montreal have adopted a by-law, which will have to be ratified by the council, imposing a realty tax and surtax on the property of the public utility companies. The realty tax is to be \$1.35 per \$100 of the value of the property, and the surtax is 5 per cent. on the property of the companies (other than water companies, which will pay 1 per cent.) situated on the streets, lanes and public places of the city and made use of for the operations of the companies. The Tramways Company is exempted from the surtax.

Flexible Rate of Fare

In a statement filed with the Federal Electric Railway Commission of the United States by the Committee of One Hundred of the United States Electric Railway Association the continuation of private ownership and protection of private capital invested is recommended. The committee further recommends the enactment of measures providing a flexible rate of fare based upon the cost of service, including a fair rate of return and a further reward based on efficiency in operation.

W. W. Freeman New President of The Society for Electrical Development

At a meeting of the Board of Directors of the Society for Electrical Development, held at the society's offices, in the Engineering Societies Building, New York City, on November 11th, Mr. W. W. Freeman was unanimously elected president of the organization, succeeding Mr. Henry L. Doherty, who has held that office since the founding of the society, nearly six years ago. As president of the Union Gas and Electric Company of Cincinnati, Mr. Freeman is well known to all branches of the electrical industry.

British Industries Fair

Admission to the British Industries Fair to be held at London, Birmingham and Glasgow in February next, is by invitation only. Canadian buyers who propose to visit the fair can obtain invitations from the British Trade Commissioners in Canada at Montreal Toronto and Winnipeg, respectively.

Extract from Mr. White's Paper

In our last issue we published an item under the heading "Some Interesting Data on Cost and Operation of Transmission Lines." By an oversight this was not credited to Mr. James White, Assistant to Chairman, Commission of Conservation. It was an extract from Mr. White's address before the Calgary Industrial Council.

Electric Railway Hazards—Causes, Effects and Remedies

By R. E. McDougall*

There is no business where there are so many possibilities for accidents as that of running an electric railway, nor any business where there may be so many different classes of injuries, both to employees and the public. Crisscrossing cities, towns and country as traction lines do, with the possibility of injury not only to employees and passengers but pedestrians and the general public as well, it is not surprising that traction men are interested in accident prevention—and not only interested to the extent of spending their money and time in this work, but are firm believers in the good that can be accomplished by education along safety lines.

Under the head of "Hazards" on electric railways we have three main classes of accident, viz:

1—Accidents to employees; 2—Accidents to passengers; 3—Accidents to pedestrians and others using streets and highways.

Accidents to Employees—Causes, Effects, and Remedies

Electric railway employees may be injured in many ways, such as: wagons; falls in our houses and repair shops; being run over by equipment; blood poisoning; being struck by falling objects, collisions between cars and vehicles; eye injuries from flying particles; falls from cars, falls into excavations, etc.

Investigation of accidents similar to above show a part of them are caused by defective equipment or conditions over which the employee has no control, but the most of them are chargeable either to carelessness on the part of the injured employee, his co-employee, or foreman, or the failure to make and enforce safety rules.

An employees' accident record quickly demonstrates who is the careless and chance-taking man and this record will be of value in helping to make employees more careful. An employee known to be reckless or willing to take chances in regard to his own safety or that of a co-worker, is dangerous on any property. In the selection of employees some thought should be given to this phase of a man's character.

Very often failure by the injured employee or his foreman to give proper care and attention to slight injuries results seriously and is followed by infection and blood poisoning, and may be the cause of losing a limb and often a life. The old saw, "A stitch in time saves nine" certainly holds good in this connection. A small first aid kit with disinfectants and bandages should be produced and kept where easily accessible, and the foreman and men should be impressed with the necessity of giving minor injuries attention.

Sometimes it is the small things that lead to the most serious accidents. One of the most distressing cases of this kind that has come under my observation recently, was due to a car on the road with a faulty trolley retriever which could have been repaired in five minutes time. A line tower truck was standing near where the car in question had to pass; two men were on the tower and the wind swung the trolley rope so that it caught the top of tower, throwing the men to the pavement, badly injuring both and probably permanently injuring one; as a result, two men were laid up for months, one perhaps for life, with a cost to the company of several thousand dollars. I might recite a number of instances of this kind, but if you will give some attention to a study of the conditions which lead up to most of this kind

of accidents, you will find it is the little things and careless acts that pave the way to bad accidents.

Accidents to Passengers—Cause, Effects, and Remedies

Traction managers and accident adjusters have found that the public believe it is the easiest thing possible to receive a serious injury on a street car; negligence lawyers are also active in propagating this idea. As a matter of fact, when you consider the number of passengers carried yearly by traction companies, with the possibility for accidents, the percentage killed or seriously injured is not nearly as high as in industrial plants.

There are of course, a great many ways by which passengers can be and are injured. Investigation shows the three most prominent causes to be:

a—Improper operation of car by employees; b—Run down condition of equipment, track, etc.; c—Carelessness on the part of injured person.

(a) Improper Operation

Improper operation of car of part of employee often causes: collisions and derailments; premature starting, thereby throwing passengers in cars, or while boarding and alighting; collision with other vehicles at street intersections; striking passengers who have alighted from cars going in opposite directions, etc.

We are all familiar with this type of operation and its results. The human element is the big factor in causing and preventing accidents. Motormen and conductors are as willing as the rest of us to do their share and the big thing is to secure their co-operation. Here, in particular, the record of trainmen is of value. If it is found that a trainman is making an undesirable record for himself the use of an itemized record in pointing out the number of accidents he has been responsible for and what they are costing the company in dollars and cents, will be of great assistance in educating that particular employee. Personal education of each employee along accident prevention lines will prove a big investment for the traction company that is willing to spend the money to do it.

It can afford high class men to do this work properly, and find at the end of a number of years that its accidents have decreased in number and have cost less. This will be the only comparison of any value that can be made, for the reason that if an accident has not happened you cannot satisfy anyone that you have prevented it.

(b) Poor Condition of Track

A high standard of maintenance with reference to equipment, track, loading platforms and other portions of the property that the public come in contact with has much to do with preventing accidents. You do not have to be told that when your tracks are not in good shape you are going to have more derailments and collisions with cars; that when equipment does not work properly you are going to throw more people daily in and off the cars. Money spent on upkeep means less accidents and reduced expenditures.

Holes and depressions in the pavement or at points where cars stop to take on and off passengers are a very common cause of accidents, often serious. Co-operation between the municipality and the company will prevent many accidents of this nature and at a comparatively small cost.

*Claims Agent, New York State Railways, Rochester, N.Y., before National Safety Council Convention.

A close watch of the conditions will save both much more money than the cost of proper upkeep.

Sometimes it pays to make conditions fool-proof. As an illustration: On the property I am connected with, for some years prior to 1913 every summer we had from five to ten cases of broken arms due to passengers, when windows were up, resting their arms on the window sill and projecting between the iron bars, which were about four inches apart on some of our equipment. The breaks were caused by coming in contact with other cars in curves, trees, sides of bridges, or other vehicles. It was costing us anywhere from two to five thousand dollars a year fighting these cases in court or adjusting the injured party's claims. In 1913 and 1914 at an expense of about four thousand dollars we added enough bars and screens to the sides of the cars so that it was impossible for a passenger to get his or her arm outside the car, and we have had but one accident of the kind since.

For years all the warnings of railway operators and the many examples of injuries due to getting on and off moving cars had no effect on the public; it was not until folding steps and doors came into common use that any reduction could be made of the class of accidents known as "Boarding and Alighting." The closing door and folding step are not necessary to the transportation of passengers, but today you cannot find a manager or operator who would say they are not worth much more than they cost in the money saved his company so far as accidents are concerned.

(c) Carelessness of Passengers

I believe I am safe in the assertion that one half of the accidents occurring to passengers on street cars are caused by the passenger's own carelessness or contributory negligence. They will get on or off a moving car if permitted, and invariably when doing so face the wrong way. Without looking they will step from a car directly in front of a moving auto or other vehicle. They will do a thousand and one things that are risky. Many women's shoes and skirts cause nasty falls resulting in broken bones or sprains and lay them up for weeks. Tight skirts and high heels cause more women to be thrown than the operation of the car. Passengers will jump off a car, cross directly behind it, and onto the track in front of a car going in the opposite direction without looking or paying the least attention to what they are doing.

Accidents to Pedestrians and Others—Cause, Effect and Remedies

Accidents in which the public (not including patrons) are involved come within the following classifications:

a—Pedestrians struck by cars; b—Pedestrians falling into excavations, over defective track, material left in street, hit by falling poles and wires; c—Occupants of vehicles in collision with cars.

(a) Struck by Cars

Many of the individuals struck by cars are children playing in streets and their injury is due to thoughtlessness more than anything else. They will chase a ball onto car tracks without a thought of a car; they will catch a ride on the rear of a wagon or truck and drop off in front of an approaching car; they will ride a sled or a bicycle down an incline across tracks, never giving a thought to the possibility of injury. Their elders also get hit for the same reason. They do not think, and rely on others to look out for their safety. Intoxication is quite a factor in this type of accident, particularly on interurban lines.

While the motormen at times are responsible for injuries to pedestrians, the majority of them are chargeable to the injured party. They could be avoided generally by the use of a little judgment or common sense. Some individuals

will hurry to cross ahead of a car and then stop and watch it go by, they will step from the curb between two automobiles or pass behind one car directly into the side or in front of one going in the opposite direction.

(b) Falling Over Materials

Most accidents under this head are caused by employees leaving materials and excavations improperly guarded and lighted. Fortunately at the present time most municipalities have ordinances requiring proper guarding and lighting, and in the event of neglect or oversight on the part of employees their attention is soon called to it by the police.

(c) Collisions

The increase in the number of motor vehicles in the past few years has resulted in an enormous increase in accidents between them and electric railway cars, and a long list of killed and injured. The most serious occur at grade crossings familiar to the auto drivers and with every opportunity to see and know of the approaching car or train travelling at high speed. Early this summer in a three weeks period, fifteen people were killed in three accidents of this type, within a radius of fifty miles of Rochester. One car was being driven by a girl of seventeen who was learning to operate the machine, one was being driven by a boy of fourteen, and the third was driven by a man who could see an express train approaching him at right angles and deliberately tried to beat the train to the crossing. Notwithstanding the fact that you read of this kind of fatality in every paper you pick up, it seems to and will continue as long as high powered automobiles are permitted to be operated by irresponsible or reckless drivers. Signs, warnings or signals will not prevent these accidents occurring; the careful, prudent driver will not take such a chance.

In order to reduce the number of street accidents the main thing necessary is education—education that will teach everyone (be he employee, passenger, pedestrian or auto driver) what it is that leads to accidents and how they can be avoided; particularly education of the young child and the school boy and girl regarding the value of life and limb, the wastefulness of unnecessary haste and neglect; education of the men and women by the passing and strict enforcement of reasonable ordinances; and education of the drunken driver and persistent chance-taker by a straight jail sentence.

Canadian Cotton Adding Power Equipment

Mr. R. S. Kelsch, consulting engineer, Montreal, has drawn plans for an extension of the power plant of Canadian Cottons, Marysville, N. B. It is intended to instal a low pressure steam turbine of 500 kw.

Book Cases for Storage and Display

In a new electrical store recently opened by a N. S. contractor-dealer, the counter cases for fuses, flashlights and small stuff are not the ordinary shelves or show cases, but are regular built-up sectional book cases. The effect is very satisfactory and the goods are kept clean and at the same time within partial view of the customer.

The earnings of the Southern Canada Power Company continue to increase. For October, the gross increased by \$8,222, and the net by \$6,904, the total of the latter being \$27,492. The industrial department of the company is very active in securing industries for the district served by the company, and during the last two months obtained six firms to locate there, mostly branches of large U. S. companies.

Canadian Electric Railways Association Holds Annual Convention in Montreal—Officers for 1920.

At the conclusion of the business meeting of the Canadian Electric Railways Association, which was in session at the Windsor Hotel Wednesday and Thursday, Dec. 3 and 4, the following were chosen executives for the ensuing year:

Hon. president, Col. J. E. Hutcheson, general manager Montreal Tramways Co.; hon. vice-president, Acton Burrows, Canadian Railway and Marine World, Toronto; presi-

Col. J. E. Hutcheson

dent, A. Gaboury, superintendent Montreal Tramways Co.; vice-president, G. Gordon Gale, vice-president and general manager Hull Electric Railway; hon. secretary-treasurer, A. Eastman, vice-president and general manager Windsor, Essex & Lake Shore Rapid Railway Co.; executive committee: Geo. Kidd, general manager British Columbia Electric Co., Vancouver; A. W. McLimont, vice-president and general manager Winnipeg Electric Railway; M. W. Kirkwood, gen-

Mr. A. Gaboury

eral manager Grand River Railway Co., Galt, Ont.; C. L. Wilson, assistant manager Toronto & York Radial Railway; F. D. Burpee, superintendent Ottawa Electric Railway; R. M. Read, superintendent Quebec Light, Heat & Power Co.; C. C. Curtis, manager Cape Breton Electric Railway, Sydney,

C. B.; and Col. G. C. Royce, general manager Toronto Suburban Railway.

The honorary presidency went unanimously to Col. Hutcheson in virtue of his being among the pioneer electric street railway men in Canada, having been in active service in that work since 1891 and instrumental in its development before that date. Col. Hutcheson has been general manager of the Montreal Tramways Co. since 1912 and was formerly manager of the Ottawa system.

Mr. A. Gaboury, the new president, was vice-president in 1919. He is thoroughly versed in every phase of electric street railway operation, having started in 1894 as a motorman and risen through the various branches until his appointment as superintendent of the Montreal system 16 years ago, which position he still holds. For years he has also been prominently identified with the "Safety First" campaign.

Mr. Paul F. Sise Steps Up to Presidency of Northern Electric Company

Mr. Paul F. Sise, formerly vice-president and general manager of the Northern Electric Company, Limited, has been elected president in succession to his brother, Mr. E. F. Sise, who recently tendered his resignation as chief executive of the organization in order to give his attention to other activities. After graduating at McGill in 1901, the new president took an apprenticeship course at the Pittsburg plant of the Westinghouse company, and was with the same company in New York from September 1902 to September 1903 when he returned to Canada and became connected with the Montreal Sales Department of the Canadian Westing-

Mr. Paul F. Sise

house Company. In December 1904, Mr. Sise became secretary-treasurer of the Northern Electric and Manufacturing Company, Limited, and in 1910 was appointed managing director of that company. When the Northern Electric and Manufacturing Company was amalgamated with the Imperial Wire and Cable Company in 1914, Mr. Sise became vice-president and general manager of the new organization. In December 1915, Mr. Sise went overseas as Adjutant to the 148th Battalion, from Montreal, was later attached to the War Office in London and sent to the United States on the staff of the British Recruiting Mission, after which he served with the Canadian Forces in Siberia—returning home in May 1919.

The Contractor-Dealer

Toronto Electrical Contractors Discuss the Financing of Time Sales—W. L. Goodwin Coming—Agreements with Employees—Open Price Plan Working Well

About thirty contractors gathered at the Hotel Mossop on Thursday evening, Dec. 4, for the regular monthly meeting of the Toronto Electrical Contractors Association. After an enjoyable dinner had been served the business of the evening was proceeded with. This was the first meeting held at the Hotel Mossop, and those present expressed themselves as well satisfied with the service. The next meeting will, therefore, be held at the same place.

President Kenneth A. McIntyre brought to the attention of the contractors certain suggestions that were made at the recent convention of the Ontario Municipal Electrical Association in regard to the appointment of local Hydro superintendents as assistant electrical inspectors, with power to order service connections, pending the visit of the regular inspector. Mr. McIntyre urged the manifest unfairness of such a procedure and mentioned that it had been opposed by several of the Hydro men at the convention. In order that the Toronto Electrical Contractors Association might be placed on record in connection with the matter, he had written Sir Adam Beck voicing support of the present inspection policy, under the Hydro-electric Inspection Department, and deprecating any change.

Mr. McIntyre read a letter from the secretary of the British Columbia Electrical Contractors' Association, enclosing a copy of the minutes of their meeting of Nov. 10, and requesting that the Toronto Electrical Contractors' Association exchange minutes with them in future. On motion of Mr. Harry Hicks, seconded by Mr. Davenport, it was agreed to do so.

Open Price Plan Discussed

There was some discussion on the operation of the Open Price plan. Mr. McIntyre pointed out that nineteen members of the association had taken advantage of the plan, up to a month ago, and from its inception up to that time, nearly 500 reports had been submitted. He described briefly how the plan worked and what it accomplished. There were some questions asked by those who had not participated up to the present time as to the possibility of the plan being used dishonestly. Mr. McIntyre answered that there was an opportunity for a crook to get away with sharp practice just once, but if he did not abide by his figure as submitted to the Open Price secretary and undercut his competitors, he was immediately shown up for what he was. Mr. Carthy suggested that there was the possibility of collusion between two contractors to obtain figures alternately and hand them over to each other. Mr. McIntyre said that crookedness could not altogether be prevented in any case, with or without the Open Price plan, but they had to go ahead on the supposition that their competitors were honest. There had, he said, been somewhat less enthusiasm in the plan latterly, and it had been decided that what was required was regular meetings. As a result the Board of Trade room, on the 19th floor of the Royal

Bank building, had been engaged for the second and fourth Thursday of each month. The meetings opened at 11 a.m. and a 60 cent lunch was served, \$2.00 being charged for the room. The members previously notified the secretary regarding items which they wished to have brought up.

In reply to an enquiry from Mr. McIntyre, most of those present who had not previously used the Open Price plan, declared their intention of doing so.

The President had a letter from the Hydro-electric Power Commission requesting that the association appoint a member on the Approval Committee of the Hydro, which passes on any new electrical devices submitted by the Hydro Laboratories as doubtful. It was moved by Mr. Hicks and seconded by Mr. Davenport that Mr. Geo. J. Beattie be asked to act on the committee.

Goodwin Coming to Toronto

Mr. McIntyre announced that Mr. Goodwin was coming to Toronto, in January, on the invitation of the manufacturers' and jobbers' associations, the Ontario Association of Municipal Electrical Engineers, the Toronto branch of the American Institute of Electrical Engineers, the Electrical Contractors' Association and the Electric Club of Toronto. All these organizations proposed to hold their conventions at the same time. Then tentative programme was that on the morning and afternoon of Thursday, Jan. 15, the electrical contractors, the manufacturers and the jobbers should have their meetings. On Thursday evening there would be a banquet of the Municipal Engineers' Association, which would be through about 8 o'clock, and it was probable that the Toronto Electrical Contractors would also have a meeting on Thursday night. The big feature would be a joint banquet of the entire industry on Friday evening, Jan. 17. Mr. Andrews had been authorized to act for the Manufacturers' and Jobbers' Association, and Mr. Clement for the Ontario Association of Municipal Electrical Engineers. It had been suggested that as The Electric Club of Toronto and the Toronto Branch of the American Institute of Electrical Engineers, were organizations with but a small annual fee and no great reserve of funds, the manufacturers and jobbers and the contractors should undertake the financial obligations in connection with Mr. Goodwin's visit and the joint meeting. On motion of Mr. Davenport, seconded by Mr. Clark, Mr. McIntyre was authorized to act for the Association and make any financial arrangements that might be necessary.

Standardization of Plugs and Receptacles

Mr. McIntyre brought to the attention of the meeting a communication from the Ontario Association of Municipal Electrical Engineers in regard to standard plugs and receptacles. At the Niagara Falls convention of that association Mr. Goodwin had emphasized the advantages of standardization, and Mr. McIntyre said it was a very important question. Wonderful advances had resulted in the lighting field when the Edison base had been made standard, and no doubt this would be the case in the appliance field also if similar steps were taken. The only opposition, as Mr. Goodwin pointed out, was from a few manufacturers who had selfish interests to serve. The Municipal Engineers had

written, asking for suggestions from the other sections of the industry. On behalf of the Toronto contractors, Mr. McIntyre had replied suggesting that a preliminary committee be appointed composed of representatives of the various organizations of electrical men. This suggestion was to be considered by the Electrical Engineers at their January convention.

Agreements with Labor

The next item of business was in regard to the recommendations of the Joint Industrial Council of the Building Trades of Toronto in connection with the fixing of agreements between employers and labor. These recommendations were:

- (1) That all agreements between employers and employees in the building trades be made to expire Dec. 31.
- (2) That this method be put into operation at once and all agreements running into 1920 to continue, but new agreements to be made this year covering the balance of 1920 and to be operative at the expiration of the present old agreements.
- (3) All negotiations to be started on or about Sept. 15 and to be completed on or before Nov. 15.
- (4) In case of failure of the employers and employees to reach an agreement on or before Nov. 15, then the settlement will be automatically placed in the hands of a board of arbitration.

(5) The board of arbitration to consist of two members appointed by the building trades league and two by the associations of employers; these four to appoint a fifth, who will act as chairman of the board.

(6) The award of the said board of arbitration shall be binding on all parties to this agreement.

Mr. McIntyre pointed out that there were two points regarding which question might be raised—the date of the agreement, which was perhaps too far ahead of the opening of the season, and whether the award of the arbitration board should be absolutely final. As to the date, he pointed out that it was now too late to affect this year's agreement in any case. Mr. Wood thought no agreement should start till about April 1, because the men would be getting dissatisfied again before the first of May. Mr. Drury, however, thought that they should let it stand for one year anyhow and then if it did not work out, change it. Mr. Carthy also believed that prompt action would be appreciated by the men and didn't see just what difference three months would make. Mr. McIntyre referred to the trouble that had been experienced with the men last summer and said that the nearer they came to the date, the less likelihood there would be of unrest. After some discussion it was decided to leave the matter in the hands of Mr. Kay, the association's representative on the Joint Industrial Council.

Financing Time Sales

Mr. McIntyre next introduced Mr. Annesly of the Commercial Credit Co., who was present to explain how the Company's service would assist dealers in financing time sales on electrical devices, such as vacuum cleaners, washing-machines and small electric motors, which are now so generally sold on a credit basis. The plan, briefly, is as follows:

The Commercial Credit Co. of Canada, Ltd., will advance up to 75 per cent. of the uncollected deferred payments, but in no case more than the original cost of the article to the dealer; for a period not exceeding twelve months. In the case of articles sold on time payments extended over more than 18 months, an amount equal to the total instalment due the dealer in the next twelve months will be paid down by the company, against the contracts on which above instalments are payable, provided the amount is not more than the cost of the articles to the dealer. At the end of twelve months, if the contracts still have some

time to run, a further advance of an amount equal to the total of instalments due in the next twelve months, may be made.

A simple form of lien note is supplied by the company, which the customer signs at the time of the sale, and which is made out in triplicate, one copy for the purchaser, one for the dealer, and the original, which is to be assigned to the company. The company's name does not appear on the note; it is made out in favor of the dealer. Contract forms are also furnished, which contain the agreement between the dealer and the company. An instalment note form is attached to the contract.

When an advance is desired against a number of customers' notes, the dealer assigns them over to the company, attaches them to the contract form, which he fills in, making out the note for the amount required. On receipt of this collateral, the company's cheque is mailed to the dealer. The company does not take lien notes in amounts of less than \$500.

Customers pay their instalments in the ordinary way to the dealer, and he pays off his note to the company in monthly payments from the customers' instalments received. The receipts from these customers' contracts each month will invariably be greater than the payments to the company.

A minimum down payment of 10 per cent. must be secured from the purchaser, and a limit of 18 months for deferred payments insisted upon, for articles on which the dealer wishes 75 per cent. advance. In the case of articles sold on longer terms than 18 months, the time given rests with the dealer; the shorter the time, the greater the advance he may obtain. As the company's advance is not made for more than 12 months, the dealer must receive from his contracts in this period an amount sufficient to retire his note.

The charge to the dealer is based on the actual amount of his obligation, the schedule being as follows: 12 months' contract, 9 per cent.; 11 months, 8½ per cent.; 10 months, 8 per cent.; 9 months, 7½ per cent.; 8 months, 7 per cent.; 7 months, 6½ per cent.; 6 months, 6 per cent.

The company does not do any collecting. If the dealer has not his name on the machine, his lien must be registered.

Mr. Beech, of the Northern Electric Co., and Mr. Hadzie, with the Canadian General Electric Co., were present at the meeting, and after the discussion on the Commercial Credit Company's scheme, expressed their readiness to co-operate with the contractors in any way possible.

Catch the Rainy Day Customer

There are lots of innocent little "kinks" in the retail business that help you increase your volume of sales. One dealer, when it rains, sets an umbrella stand just outside the entrance door. A protecting canopy over the display window and doorway is a silent invitation to passers-by to step in out of the wet and examine the display. A window card with some such wording as "Step inside until the shower passes over" will lend further assistance.

The ratepayers of the border municipalities have voted in favor of the acquisition of the Sandwich, Windsor and Amherstburg Railway by the Hydro-electric Commission.

A vote will be submitted to the ratepayers of Windsor, Ont., at the January elections on the question of taking over the light and power plant of the Sandwich, Windsor and Amherstburg Railway Company.

The Waterloo, Ont., water and light commission have decided to install an additional seven transformers which will give them about double their present power capacity.

"Merchandising Ethics"

By Samuel Adams Chase

In almost all kinds of business which have the experience based on any long perspective, "hind sight" we may call it, the difference between the jobber and the retailer is clearly defined. Their boundaries are marked by so many danger signs that practically no one attempts to overstep them. Marshall Field & Company seem to be an exception but even with that firm and even before the death of Marshall Field, the wholesale and retail stores were separated by half a mile, geographically; and they sold to—and bought of—the retail and wholesale branches precisely as if there were no relation.

Jobbing is as definite a public need as any other division of business. The jobber is a financial necessity to the trade. He is an auxiliary reservoir of credits and supplies. He is the banker, the warehouse of the retailer. No one can take his place because no one is able to have or to get the special knowledge if the retailers needed to conduct the jobber's business. The manufacturer cannot do it successfully and when he tries to do it, usually he busts. He ought to.

Electrical Merchandising Lacks Perspective of Experience

Electricity is a new force and the sale of electric apparatus is newer. Therefore, it lacks the perspective of experience which almost all other kinds of business have the advantage of and are guided by in their mutual relations. It is not strange that men in a new business should try new methods; should overstep boundaries where no boundaries are known to exist. But that time,—that period of adolescence has very nearly passed. It is sufficiently clear now that the rules of the dry-goods trade, the boot and shoe trade, etc., apply with equal force to the electrical trade if I may so call it. The rules of the game are identical and they cannot be violated without inquiry. **Jobbers must have the retailers and when they attempt to do an over-the-counter business, they are starving out the source of their own prosperity.**

Go down through the wholesale dry-goods district and look at the sign in each window—"wholesale only,—no goods sold at retail." You do not need to be told that this is not a work of altruism on the part of the jobber. It is purely selfish. He knows that he will be boycotted off the street, if he attempts to do a retail business.

Is there any right or wrong about the matter? Apparently not, unless there is an implied obligation not to do certain things,—that is, for instance, selling at retail when you call yourself a dry-goods jobber. You have no such distinction to-day in the electric trade. Would it not be better, would it not sweep away a lot of cobwebs if you had?

These are not class distinctions; they are differences in function. When a customer buys a pair of shoes he buys the services of the jobber who warehouses them and carries the credits, or notes, of the retailer who, on his part, provides the store where the shoes are displayed and the attendant who displays them and makes the sale.

Merchandising Functions Cannot be Combined Effectively

These functions cannot be combined effectively. Always the attempt has led to disturbances and often to disasters. We North Americans like to make our own experiences without regard to that of others, so we pay for it. Everything that is worth anything costs about what it is worth. Experience ranks high in value, so if you persist in making your own, it will cost money.

Is it not a fact that when the jobber attempts to conduct a retail business he immediately increases the overhead, without realizing it, on his entire business, owing to expen-

sive location, distance from shipping facilities and other causes; also disturbs trade conditions creating distrust and competition from retailers and other legitimate customers of the jobber?

Sir Walter Scott saw the publishers growing rich upon the sale of the books he was writing. "Why," he asked, "should I not have this money?" Why not? So he founded a publishing house of his own—and busted sky-high in a very short time. His last years were embittered by the struggle to pay the debts.

Every author knows this story. Mark Twain knew it. Nevertheless he wanted to hog the publishers' profits so he founded a publishing house—and busted sky-high in a very short time. H. H. Rogers came to his assistance, in which he was luckier than Scott, but most of the rest of his life was embittered by the struggle to pay his debts.

There are plenty of other comparisons to show the folly of trying to change the economic boundaries which have been fixed by a century or two of the experience of hundreds of thousands of successful merchants.

Honesty is the Best Policy

How can we hook up the term "honest" with the term "experience." At first sight they seem to have no relation to each other. Yet "honesty is the best policy." Honesty of course, is merely being "on the square," "playing the game." Any other scheme in business is pure folly. A slight profit, a temporary advantage may be gained by departing from the rules, but a man who undersells when he promises that he will not, or associates suppose him to be taking only one profit, is bound straight for the rocks. He is surrendering not only his character for honesty, but is violating the recognized laws of business,—commonly expressed as "experience."

Sortly before his death, J. P. Morgan testified that to one man he would loan a million on his bare word, while to another he would not loan a cent on any kind of collateral. This is nothing but a picturesque way of describing the way in which experienced business men regard each other; the way in which they regard each other based upon the "experience" which they and their forefathers have gathered and formulated into the laws of business.

Nothing is more certain in business than that the profit is based upon the cost of doing business. The jobber's cost is low; the retailer's cost is high, relatively. Does it sound rational that either a jobber or a retailer should demand both of these profits when the great mass of his fellows are content with only one of them? Not only is it irrational but because it is irrational it will become impossible. Automatically without much, if any, effort on the part of the individual, jobbing and retailing will settle down together like the lion and the lamb—side by side, gentlemen, and not one of them inside the other.

In closing, may I thank you for your attention and for the privilege of having been permitted to address you. And may I ask you this riddle?

"If the Shoemaker should stick to his last, what should the Jobber do?"

Quick "Make" and "Break" Switch

J. H. Tucker & Company of Birmingham, England, are placing a new tumbler switch on the market. It is identical in size and external appearance with the flat type tumbler switch, but possesses the advantages of both a quick "make" and "break," whereas the old type had simply a quick "break." The company state that large quantities of these switches have been used during the past four years by various departments of the government, but that, having now finished all contracts in that direction, the switch is offered to the trade for general lighting purposes.

Here's a Christmas Present for You

YOUR WINDOW DISPLAY IS YOUR BEST SALESMAN

Between now and Christmas the Electrical-Dealers of Canada will be putting forth their best efforts to attract the holiday trade and some fine window displays will be shown.

The biggest problem before the electrical industry to-day is not engineering or manufacturing—the real problem is “merchandising.”

We believe that well dressed windows—goods properly and tastefully displayed and demonstrated—are the most effective means of increasing the sale of electrical appliances.

With a view to encouraging the art of window dressing among electrical contractor-dealers, and, also, having in mind the value of the interchange of good merchandising ideas, the Electrical News offers four prizes for best dressed windows, under the following conditions:

- | | | |
|-----|--|---------|
| (1) | First prize | \$35.00 |
| | Second prize | 20.00 |
| | Third prize | 10.00 |
| | Fourth prize | 5.00 |
| (2) | The contest is open to any electrical contractor-dealer, municipality or central station in Canada. | |
| (3) | Photographs of window displays must be in our hands by December 31, 1919. | |
| (4) | Explanatory notes up to 100 words may be submitted with each photograph. | |
| (5) | The merits of the photographs will be judged by an impartial committee of three—one manufacturer, one jobber, one contractor-dealer. | |

Plan now to enter the competition. You have an even chance to win a prize. In addition to that, however, it is a dead certainty that your effort to produce a better window display will be reflected in your more abundant Christmas trade.

Address photographs and all communications:

“Best Window” Contest,

Electrical News,

347 Adelaide St. W., Toronto.

What is New in Electrical Equipment

Fans de Luxe

Heretofore the electric fan has been designed solely for utility, and, though the better grades have graceful lines and fine finishes, all makes have been kept plain and devoid of ornamentation. This simplicity is suitable for the great majority of purposes for which the fan is used, but there is said to be a growing demand for fans that will harmonize with the handsome furnishings of hotels, clubs, theatres, offices, and private residences.

To enable architects and interior decorators to obtain fans that will carry out any desired scheme of decoration, L. Plaut & Company, New York, have brought out a de luxe line of fans, consisting of 10, 12, and 16-inch oscillating fans of Westinghouse make encased in ornamental compo, finished by the company's skillful artists in any desired manner.

A comprehensive series of standard designs, covering recognized periods, has been produced but special designs to suit any original decorative plan can be readily produced. Standard finishes are French-gold, French-grey, and old ivory but any other colors, including polychrome, can be supplied. In addition to the compo covered fans there is also a novel and attractive line with decorative reed coverings, which strike a distinctive note of coolness and infor-

mality. The fans are supplied for desk, table, and bracket mounting but their effectiveness is enhanced by mounting them on columns or standards of wood, ornamented with compo, or of reed, which have been designed by the Plaut

company to harmonize with the fans. These standards are wired and have a plug at the top to which the fan is connected. The fan can therefore be easily removed as desired and a lamp, plant, or other object put in its place.

Serving Farmers from High Tension Lines

The rapidly increasing demand for farm service has developed the need for a complete switching, fusing, choke coil and lightning arrester unit, which can be installed near the farmers' premises. The new unit type equipment developed by the Delta-Star Electric Company, Chicago, is claimed to meet the imposed condition and, furthermore, can be

installed at a reasonable cost. The two pole switch is operated from ground level and, in case of fuse operation, replacement can be safely made by the farmer. Either steel or wood pole mounting can be employed, depending upon the local conditions or desired investment. This new unit should be of material assistance to those utilities so situated that farm loads can be served.

Examples of De Luxe line of Westinghouse Fans

The Eye-Shield Diffuser

The tendency in commercial and industrial lighting for the last few years has been toward lamps of higher efficiency as a means of securing better illumination in offices, shops and factories. Such lamps as the modern tungsten and nitrogen (gas filled) are of recognized economic value. Wherever a study of the lighting problem has been made, it has been found that speedier work and a better quality of workmanship is the result of increased lighting efficiency. The modern lighting problem, however, is not satisfied with increased light intensities alone. Direct illumination, which concentrates the rays in an extremely intense flood of light or spot light effect, is very confusing to the eye over the field of vision. The ideal light is one in which the high in-

trinsic rays of the modern high efficiency lamps are shielded from the eye, at the same time preserving their high efficiency.

That is the basis upon which the Luminous Specialty Co. state they proceeded in evolving the eye-shield diffuser, shown herewith. In this diffuser the translucent bowl is very thin, having an absorption of about $7\frac{1}{2}$ per cent. The reflector, being semi-translucent, throws a soft diffusion of light over the upper area to be illuminated, gradually blending to its greatest volume on the working plane. This offers to the eye no sharp contrasts of lights and shadows. The absence of glare is most desirable and congenial to the eye; relieving eye-strain altogether and at the same time securing the greatest volume of useful light of low intensity on the plane to be illuminated.

The eye-shield diffuser is made for use with all forms of tungsten and type "C" lamps up to and including 200

watts. It can be installed in any fixture now used or in and fixture in which the type "C" or gas-filled lamps can be installed. A combination plug and socket is provided which fits the socket in the fixture. A wire holder supports the diffuser. This diffuser is used at all points where more efficient illumination is required, but is particularly adapted for commercial and industrial work, and particularly in schools where the utmost consideration should be given to conservation of the eye. It is being distributed throughout Eastern Canada by The Perkins Electric Company of Montreal, Toronto and Winnipeg.

The Hoover a Three-in-One Cleaner

The Hoover Electric Suction Sweeper is now being made in Hamilton, Canada, in a factory which affords the manufacturer some 30,000 square feet of floor area at the outset, with provision for double this area when demand develops. The Hoover is well known in Canada already, but will be thoroughly advertised throughout the coming year so as to make its sale by the contractor-dealer little more than a matter of display. It is claimed that its popularity depends largely on the fact that it is three cleaners in one: an electric carpet beater, an electric carpet sweeper and an electric vacuum cleaner.

The Amco Illuminet

The Amco Illuminet, illustrated herewith, is a new lighting fixture which is claimed to combine all the latest improvements in industrial and commercial lighting in a small unit which may be applied to the fixtures installed in the home. To the ordinary socket is simply added a spun-

holder, a porcelain enamelled steel reflector and a specially designed and carefully calculated diffusing squat shade. This unit makes it possible for the housewife who wishes to materially improve her illumination to do so without going to the expense of entire new fixtures. The present holders and lamps may be removed and the Amco Illuminet just pushed on to the socket. A stock of illuminets is carried by the Masco Company, Toronto.

The city of Saskatoon, Sask., recently advertised for sale by tender a 26 x 48 vertical cross compound engine direct connected to a 750 kw., 2 phase, 2,300 volt, 60 cycle generator, complete, with surface condenser, air pump, etc. This equipment is to be replaced by new machinery of larger capacity.

**DON'T
GET
HURT
TO-DAY**

A poster issued by the Ontario Safety League. Its effectiveness is in its simplicity

A New Safety Push Button Panel

In order to provide a safety lighting panel of small capacity for apartment houses, residences, etc., the Westinghouse Electric & Manufacturing Company has recently put on the market its type "C" safety panel. These panels are made up of push buttons and plug fuses, and all parts accessible are electrically dead so that the operator is in no

danger of getting a shock in turning the lights on or off. Each pair of buttons with the fuses constitutes a unit, and should a switch become damaged all that is necessary is to remove the switch cover section and unscrew the defective part, without disconnecting any wires, exposing other switches, or removing the panel from the box. By reason of its construction, this panel is the narrowest safety panel on the market, and the only one of its capacity that can be furnished with a safety-type main switch if desired. These panels are made for two or three wire systems, and for from two to thirty-two branch circuits. The capacity of the main ranges from 30 to 200 amperes, 125 volts, and the capacity of each branch circuit is 10 amperes.

The Crystal Washing Machine

The Crystal Washing Machine illustrated herewith, is being distributed in Canada by the Onward Manufacturing Co. of Kitchener, Ont. The Crystal forces the water, steam, rich suds and air through the meshes of the

cloth, cleansing the coarsest or the finest of fabrics without rubbing or injuring of any kind. The cylinder drives in only one direction, making it easy to maintain a speed which removes the dirt without resorting to complicated mechanical parts found in less efficient machines. Only 15 minutes is required to wash each cylinder full of clothing. The swinging mechanism on this machine makes it easy to put the wringer in three positions; the clothes may be wrung from the machine into the rinse water, from the rinse water into the blueing water and from the blueing water into the clothes basket. It is not necessary to move the washer itself, as the wringer swings freely into position wherever and whenever it is needed. Special features of this machine are the automatic safety friction release which protects the machine when overloaded; the safety wringer release which releases wringer instantly in an emergency; and all moving parts are covered, making it impossible to get caught in the mechanism.

Magnetic Brake for Small A. C. Motors

The cut herewith represents a new type of magnetic brake that has been designed by The Volta Manufacturing Company, Limited, of Welland, Ont. This brake is designed specially for small a.c. motors up to $7\frac{1}{2}$ h.p. These brakes

have been thoroughly tested and all that have been put into service are giving absolute satisfaction. This new type of magnetic brake has many points of advantage over the old type. Note the simple and rugged construction; the absence of toggle joints and wearing parts; the minimum space required and the simple manner in which adjustments can be made.

Davis Slate and Manufacturing Co.

Davis Slate & Manufacturing Company of Canada, Ltd., announce that their sales office is now located at their Toronto factory Shaftesbury and Summerhill Aves.

It is reported that a committee of the London County Council officials has been appointed to confer with the Illuminating Engineering Society to consider the question of eye strain in connection with movie pictures.

Current News and Notes

Almonte, Ont.

The ratepayers of Almonte, Ont., will vote on the question of acquiring the power plant of the Wylie Power Company.

Bathurst, N. B.

The Bathurst Lumber Company are installing a hydro-electric plant at Grand Falls, about 25 miles from Bathurst, N. B. Orders have been placed covering two 4,000 k.v.a. generators with necessary transformers exciters and control for this installation. Power will be transmitted to Bathurst and there distributed to their various pulp and lumber mills. Professor Herdt, Montreal, is the consulting engineer.

Chatham, Ont.

The Chatham, Wallaceburg and Lake Erie Railroad is now installing new equipment necessary for the use of Hydro-electric power. Some of this equipment was purchased from the London and Lake Erie Railway, and the balance from the Canadian Westinghouse Company.

Cornwall, Ont.

The ratepayers of Cornwall, Ont., will vote, on December 19th, on the question of extending the franchise of the Stormont Electric Light and Power Company, Limited.

Edmundston, N. B.

The town of Edmundston is making extensive additions to its electric power plant and system. A new generator and larger transformers are being installed and the distribution system extended to connect up some 200 new customers. The starting up of pulp mills has caused this rather unusual boom.

A company is now being formed to develop a Hydro-electric plant on Green River, about six miles from the town of Edmundston, N.B. It is proposed to install about 1500 kw. and transmit power principally for distribution in the State of Maine. Dr. Guy is the promoter of this development and Mr. C. Brandeis, Montreal, is the consulting engineer.

Gilbert Plains, Man.

A by-law will be submitted on December 16th to the ratepayers of Gilbert Plains, Man., on the question of installing an electric lighting plant. The town council are interested in quotations for equipment.

Gleichen, Alta.

Work has commenced on the erection of a power house at Gleichen, Alta., for the provincial government. C. C. Potter and Company, Medicine Hat, are the general contractors.

Guelph, Ont.

The ratepayers of Guelph, Ont., will vote at the January elections on the Hydro Radial by-law.

The board of light and heat commissioners, Guelph, Ont., have received notice from the Hydro-electric Power Commission limiting their power load to 3200 h.p. from 7 a.m. to 6 p.m. and to 2630 h.p. from 6 p.m. to 6 a.m.

The Guelph, Ont., Board of Light and Heat Commissioners are trying the system of having customers read their own meters. Forms, instructions and stamped envelope are furnished each customer who is asked to return the reading by a certain specified date.

Halifax, N. S.

The Nova Scotia Tramways & Power Company are making extensive improvements to their equipment. The

entire distribution system has been rebuilt and feeder regulators installed. They are rebuilding most of the railway system and installing new and heavier rails. Fifteen one-man safety cars have been ordered and will be put in service immediately. This company is now controlled by the Stone & Webster Corporation of Boston.

Hamilton, Ont.

It is reported that the Walker Electric Company, Hamilton, Ont., have sold out.

The Tallman Brass & Metal Company, Hamilton, Ont., have purchased 14 acres of land on Burlington Street, south of Stipes Inlet, to take care of necessary extensions to their plant.

Hanley, Sask.

The proposed installation of a lighting system at Hanley, Sask., has been postponed until Spring awaiting the approval of the provincial government.

Joggins, N. S.

The Maritime Coal, Railway & Power Company, Joggins, N.S., are planning the installation of an additional two 1000 kw. steam turbines with necessary auxiliaries. Mr. Sammett, Montreal, is consulting engineer employed by this company.

Kamsack, Sask.

A by-law has been passed by the ratepayers of Kamsack, Sask., authorizing the purchase of an auxiliary engine and extensions to the local lighting plant.

Kentville, N. S.

The Kentville Electric Light Commission will purchase current from the Nova Scotia Sanitorium and close their present steam plant. The Sanitorium is putting in all necessary transformers, etc., and supplying current at their switch board at a price of 4½ cents per kw.h. This arrangement will give the town a much needed day service. The Kentville Commission are also installing a modern series street lighting system.

London, Ont.

The Bell Telephone Company have started alterations to their London exchange, which will include an additional story on the building and the installation of considerable new equipment.

The Hydro-electric Power Commission of Ontario have reported to the city council of London, Ont., that it would not be advisable to entertain the purchase of the London Street Railway as, in their opinion, it could not be operated as cheaply as the company is now doing.

Moncton, N. B.

The city of Moncton, N. B., is considering the purchase of the entire light, power and tramway of the Moncton Tramway and Power Company. If this deal goes through the city will install a modern power plant as the present outfit is overloaded. John Edington is city engineer of Moncton.

New Glasgow, N. B.

The Nova Scotia Steel Company have recently purchased the plant of the Acadia Coal Company at Stellerton. This latter company has a most complete and extensive electric power plant and it is probable that the Nova Scotia Steel Company will transmit some 4,000 kw. from this plant to their works at Trenton, a distance of seven miles, and

electrify their steel mills, which are now principally operated by steam.

New Liskeard, Ont.

It is reported that a power development plant is contemplated at Fort Metachewan, Ont. Sutcliffe & Neelands, New Liskeard, Ont., are named as engineers, and the capacity of the plant would be about 5,000 h.p.

Newmarket, Ont.

The ratepayers of Newmarket, Ont., will vote on a by-law authorizing the renewal of their contract with the Toronto and York Railway for the electric power supply of the town. The existing contract was signed in 1914 and, it is said, has proved very satisfactory.

New Westminster, B. C.

Mr. A. Rowell has opened an electrical contracting business in New Westminster, B.C., and will specialize in lighting installations and motor repairs. Mr. Rowell has been about 20 years in the electrical business, for some time being in charge of the electrical work at the Poplar Island Shipyards and also with the British Columbia Electric Railway Company.

Niagara Falls, Ont.

Fire on December 10th completely gutted the local car barns of the Niagara, St. Catharines and Toronto Street Railway, destroying also two of the newest type cars and a snowplough. The loss is estimated at \$40,000. Power is being supplied by the International Railway Co. until the local power house can be put into commission again.

Ottawa, Ont.

Another step in the negotiations between Canada and the United States for navigation and power development on the St. Lawrence, west of Montreal, has been taken in the completion of a series of questions to be submitted to the International Waterways Commission. These have been prepared and agreed upon by Col. Keeler, representing the United States, and W. J. Steward, Dominion hydrographer. These questions cover the claims of both countries in power to be developed and navigation channels improved, as well as the responsibilities of each for cost, maintenance and damages.

Penhold, Alta.

An electric lighting plant is being installed at Penhold, Alta.

Peterboro, Ont.

At a meeting of the Peterboro branch of the Engineering Institute of Canada on December 7, Mr. W. H. Smith, of Belleville, superintendent of the Central Ontario System of the Hydro-electric Power Commission, assisted by Mr. G. Blackwell, gave an address outlining the development of the Central Ontario System.

St. Thomas, Ont.

The debenture by-law for the purchase of the London & Lake Erie Traction Company's property in St. Thomas at \$25,000 was carried by a vote of 475 to 37. The purchase includes the brick barns, power house, overhead wiring on Talbot Street and land along the M. C. R. property.

Tara, Ont.

The ratepayers of Tara, Ont., will vote on a Hydro enabling by-law at the January elections.

Toronto, Ont.

Announcement has been made by the Hydro-electric Power Commission of Ontario of a plan whereby pensions and sick benefits will be provided for employees. Details of the plan are now being completed.

The board of control, Toronto, has instructed the Works Commissioner to proceed with extensions to the

line and equipment of the Bloor Street West civic car system at a cost of \$160,000.

Customers of the Toronto Hydro-electric System have been notified that, beginning January 1, the discount on a.c. power bills will be cut from 20 to 10 per cent. Lighting and household bills will not be changed.

Windsor, Ont.

Extensions of the telephone system serving the border municipalities are being planned at a cost of \$200,000. Improvements will include erection of a new exchange at Walkerville to serve the district east of Langlois Avenue. Cables in conduits will replace overhead wires in many sections and Wyandotte and London Streets will be entirely cleared of poles. Walkerville exchange will be built in the Spring.

Personals

Mr. N. S. Marsh, of Fort Frances, Ont., has been appointed Hydro-electric inspector with jurisdiction over Fort Frances and surrounding district.

Sir Adam Beck sailed for England on Dec. 13th to visit Lady Beck, who is said to be critically ill. He expects to be absent until about the middle of January.

Mr. L. J. Barry, formerly with the Seymour Light & Power Company, has taken over the management of the electrical department of Allen General Supplies, Limited.

Mr. J. D. Black, for sixteen years with the Fredericton "Gleaner," has been appointed to organize a publicity department for the New Brunswick Telephone Company. This new department will seek to improve the relations between the company, its employees and subscribers.

Mr. Alexander McDonald, of Montreal, has been appointed traffic superintendent of the Winnipeg Electric Railway System, succeeding R. R. Knox, who has been made assistant to the general manager. Mr. McDonald has been connected with the Montreal Tramways Company since 1887, and for the past eight years has been in charge of one of the important traffic divisions of the Montreal system.

Capt. W. S. Montefiore, M.C., is now a partner in Spielman Agencies, Montreal. Capt. Montefiore was associated with this firm before he went overseas, early in 1915. In the meantime he has been with the Imperial Army on the Western front, Egypt and Palestine. Capt. Montefiore has recently returned from England and reports that although conditions are by no means normal, the firms his company represents are in a much improved position for making deliveries, and that several large shipments from their principals are now on the way.

The Cleveland Fare Box Prevents Mistakes

It is the one sure method of collecting fares without possibility of mistakes or losses in any way.

THE CLEVELAND FARE BOX is an important advancement in street car service to the public in safeguarding the interests of the municipality or company, and in saving time and labor.

Write for further important facts regarding this practical and valuable means of collecting fares.

Advertisements under "Situation Wanted" or "Situation Vacant" are charged at two cents a word per insertion, minimum charge 50 cents.

Advertisements for tenders, equipment, wanted or for sale, etc., or miscellaneous, are charged at \$2.80 per inch.

All advertisements must be in the publisher's hands by the 10th or 23rd of the month to insure insertion in the subsequent issue.

WANTED, Engineer familiar with Transformer Design. Must be technical graduate. State age and experience. Apply Box 79, Electrical News, Toronto. 23-2

WANTED—A man for testing and inspecting Transformers.
PACKARD ELECTRIC CO., LIMITED,
23-1 St. Catharines, Ont.

Transformers

We now have a well-equipped shop for the repair of service transformers up to 50 K.W. capacity.

This is our specialty and we have had considerable experience along these lines.

Instead of discarding burned-out transformers, send them to us for expert repairs. We are prompt and can give satisfaction.

Judicial Sale by Tender of the Assets of Kirkfield Portland Cement Company, Limited

In the Supreme Court of
Ontario

Shortreed vs. Kirkfield Portland Cement
Company, Limited

Pursuant to the judgment made in this action and with the approval of J. A. C. Cameron, Esquire, Official Referee, tenders will be received up to twelve o'clock noon of **Wednesday, 21st January, 1920**, addressed to J. A. C. Cameron, Official Referee, at the office of G. T. Clarkson, Receiver, 15 Wellington Street West, Toronto, and marked "Tenders re Kirkfield Portland Cement Company, Limited," for the purchase of the following assets of Kirkfield Portland Cement Company, Limited, namely, Real Estate being in the Townships of Bexley, Laxton and Somerville, Victoria County, Ontario.

Parcel 1.—Real Estate and Cement Plant.

- (a) Mill site about 12½ acres.
- (b) Ranch about 98 acres.
- (c) Dry marl bed about 50 acres.
- (d) Land opposite mill site about 7 acres.
- (e) Marl bed under Raven Lake about 354 acres; together with the buildings, erections, plant and machinery situate on parcel (a). Full descriptions of the several parcels are to be seen in the office of the Receiver, G. T. Clarkson, 15 Wellington Street West, Toronto.

Parcel 2.—Water Power and Plant and Transmission Lines.

(a) Lot A, Concession B, Somerville. Lot B, Concession A, Somerville. Lot 9, Concession 11, Laxton, excepting 1 acre heretofore sold by A. Hastings, containing about 148 acres and subject to the reservations as to Government rights set out in the mortgage of 30th December, 1910, made by Kirkland Portland Cement Company, Limited, to National Trust Company, Limited, in the pleadings mentioned, together with the buildings and machinery comprising power plant; also transmission lines.

(b) Lot D, Concession A, Somerville, and part of Lots 6 and 7 in Concession 11, Laxton, containing about 143 acres, subject to said reservations as to Government rights. It is estimated that on this property an additional 300 H.P. could be developed.

Parcel 3.—Stores, supplies, etc., as per inventory which may be seen at the Receiver's office.

Parcel 4.—Office furniture, as per inventory, which may be seen at the Receiver's office.

Tenders will be received for the purchase from the Receiver of the whole of above described property en bloc or in the alternative for the purchase of parcel 2, known as the Water Power and Power Plant, etc., and for the separate purchase of the said parcels 1, 3 and 4, with the buildings, plant and machinery thereon, together with equipment and supplies.

Intending tenderers may obtain particulars of the terms and conditions upon application to the Receiver, G. T. Clarkson, 15 Wellington Street West, Toronto.

Tenders will be opened by the Official Referee,

or the Receiver, at the Receiver's office, 15 Wellington Street West, Toronto, on Thursday, the 22nd January, 1920, at eleven o'clock in the forenoon, when all tenderers are requested to be present.

The highest or any tender not necessarily accepted.

A marked cheque for ten per cent. is to accompany each tender. Upon acceptance of any tender, fifteen per cent. of the purchase price, in addition to the marked cheque of ten per cent. accompanying the tender, shall be paid forthwith. Twenty-five per cent. in addition shall be paid within thirty days thereafter and the balance upon the completion of the sale.

In the event of acceptance of a tender the property shall be forthwith insured and the premium paid by the purchaser and the property shall be kept in repair by him, taxes and insurance to be apportioned as of the date of acceptance.

The purchaser shall search the title at his own expense, and the vendor shall not be required to furnish any abstracts or copies of them or to produce any deeds, declarations or other evidence of title, other than those in his possession. The purchaser shall have ten days in which to make any objections or requisitions, and if the Receiver shall from any cause be unable or unwilling to satisfy them he may, notwithstanding any intermediate negotiations, rescind the sale, in which case the purchaser shall be entitled only to a return of the deposit money, without interest, costs or compensation.

In case of default by the purchaser, after notice, the Receiver may declare the deposit forfeited.

In the event of a sale, possession will be given upon payment of the said fifty per cent. of the purchase money.

The other conditions of sale will be the standing conditions of the Court.

Full particulars of the property, machinery and all other details can be had upon application to G. T. Clarkson, 15 Wellington Street West, Toronto, or to Messrs. Cassels, Brock & Kelley, Vendor's solicitors, 85 Bay Street, Toronto, or to Messrs. Henderson & Boyd, Traders Bank Building, Toronto, or to Messrs. Blake, Lash, Anglin & Cassels, 25 King Street West, Toronto.

29th November, 1919.

CASSELS, BROCK & KELLEY,

85 Bay Street, Toronto,

24-1 Vendor's Solicitors.

Consider the Advantages of the Form A Post Insulating Supports

They have been designed and constructed to meet the requirements of Central Stations and Industrial Companies, and their extensive use has proven that this object has been well achieved.

The Form A Insulating Support has corrugated porcelain post, with corrugations varying with the working voltage, and metal thimble at each end. Porcelain units are made for 3,500, 7,500, 15,000 and 25,000 volt service. Any of the bus holding units can be attached to any of the porcelain units.

Greater durability is thus assured, and enables changes to be made to supports on the ground.

All supports are adjustable on both horizontal and vertical planes.

The porcelain parts are made according to the best principles, so that the electrical characteristics of each piece measure up to a standard.

Send for bulletin which will give you useful information on insulating supports.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

"American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$4.00.

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$2.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price \$1.50.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$2.50.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$2.50.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price \$2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price 50c.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$5.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electric Power Transmission, Principles & Calculation, by Alfred Still. 2nd Edition, revised, enlarged and rewritten. Just published by McGraw-Hill Book Co., Inc. 407 pages, illustrated. Price \$4.00.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price 75c.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 50c.

"Elements of Radiotelegraphy," by Ellery W. Stone. Recently published by D. Van Nostrand Company, 267 pages, 125 illustrations, 33 plates. Price \$2.50.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$1.50.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price \$1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

"Governors and the Governing of Prime Movers," by W. Trinks. Recently published by D. Van Nostrand Company. 236 pages, 140 illustrations. Price \$3.50.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

Induction Coils in Theory and Practice, by Prof. F. E. Austin. Published this year by the author. 64 pages, illustrated. Price \$1.00.

International Library of Technology, Vol. 11.B, on Electricity and Magnetism, Electrodynamics, Electrical Resist-

ance and Capacity, The Magnetic Circuit, Electromagnetic Induction, Chemistry and Electro-Chemistry. Primary Batteries, Electrical Measurements, 585 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

International Library of Technology, Volume 14-C on Storage Batteries, Incandescent Lighting, Arc Lighting, Interior Wiring, Modern Electric Lighting Devices, Electric Signs, Electric Heating, 540 pages, fully illustrated, half Morocco bound. Published by The International Textbook Co., 1905. Price \$3.50.

"Powdered Coal as a Fuel," by C. F. Herington, recently published by D. VanNostrand Co. 211 pages with 84 illustrations. Price \$3.00.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.00.

Standard Wiring, 1919 Edition, 25th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 955 pages, 630 illustrations. Price \$2.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.

"The New Competition," by Arthur Jerome Eddy, 6th revised edition, price \$1.60.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 50c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price 75c.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.25.

ECONOMY renewable FUSES

are the *right* fuses to protect *your* electrical circuits—

—because they afford the right sort of protection; their reputation lends assurance that you can safely depend on them for accuracy of rating and all-round efficiency in operation.

—because they cut annual fuse maintenance costs 80% as compared with the use of one-time fuses, owing to the fact that an inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency.

—because it's the work of a moment to replace the link and renew the fuse.

—because a good sized stock of "Drop Out" Renewal Links always on hand represents but a small outlay.

ESTABLISHED 1849
BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamilton,
Ont.; London, Ont.; Montreal, Que.; Ottawa,
Ont.; Quebec, Que.; St. John, N.B.; Toronto,
Ont.; Vancouver, B.C.; Victoria, B.C.; Win-
nipeg, Man.; Calgary, Alta.; Edmonton, Alta.;
Sydney, N.S.

THOS. IRVING,
Man. Western Canada, Toronto.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

XCELADUCT

(GALVANIZED)

Manufactured by
National Conduit Co., Limited
Toronto

Among Other Features, Ball Bearings Make the St. Louis a Much Superior Induction Motor

The usual trouble of the induction motor that has the ordinary sleeve bearing, is entirely absent in the St. Louis motor, as it is fitted with high grade ball bearings. And the bearings are so contained as to be free from grit or dirt.

Disassembled View of Motor

By the torque characteristic of the St. Louis, losses in the stator iron and copper are minimized, and there is greater starting torque on considerably less starting current.

The St. Louis motor is very strongly built, and bolted to separate base. It has exclusive construction of rotor, centrifugal switch, terminal leads, and low temperature rise.
